Minimum Payments and Debt Paydown in Consumer Credit Cards

Benjamin J. Keys (University of Chicago)
Jialan Wang (CFPB & University of Pennsylvania)

The views expressed are those of the authors and do not necessarily represent those of the Director of the Consumer Financial Protection Bureau nor those of the staff.
Our Goals: Describe Behavior, Estimate Effects of Policy Changes

1. Describe taxonomy of borrower behavior
   - Classification of payment behavior by borrower: full payer, minimum payer, mixed payer
   - Persistence of behavior within customer
   - Distribution of payments by fraction of balance

2. Estimate impact of minimum payment formula changes and disclosures on payment behavior
   - Increases in minimum payment floor
   - Three payment-related disclosures mandated by the CARD Act
Sample Description and Payment Behavior Taxonomy
Sample: General-Purpose Cards From Several Large Issuers

Credit Card Database (CCDB)

• Majority of all U.S. credit card outstandings
  – Analysis sample: several large issuers, 13 million observations

• Account-level monthly summary data
  – 2008 to present

• Linked to TransUnion credit record quarterly snapshots of debt profile

• Cannot link multiple accounts per customer, but can look at substitution effects
## Summary Statistics

Most Accounts Exhibit Consistent Payment Behavior

Payer types defined based on whether more than 50% of an account’s statement months with positive balances were paid in full, paid with the minimum amount, or paid within $50 of the minimum.
Payment as Fraction of Balance is Bimodal Within All Payer Types

This is also true within-borrower.
Research Strategy #1: The Impact of Changes in Minimum Payment Formulas
Identification Comes from Issuer-level Changes in Minimum Floors

• Several issuer-level changes in sample period
  – Increases in the minimum payment “floor” (i.e. flat part of the overall formula)
  – Different consumers are impacted differently depending on their balance and revolving behavior, generating within-issuer variation

• Empirical approach
  – Triple differences regressions
  – Controls for issuer, calendar month, consumer and card characteristics, account payment behavior
  – Robust to specifications with account fixed-effects
  – Standard errors clustered by issuer-month
Identification: Changes in Minimum Payments Differ by Balance

Graphs show a stylized version of typical issuer minimum payment formulas:

\[
\text{minimum payment} = \max \{ \text{floor, } 1\% \times \text{balance} + \text{interest} + \text{fees}, 2\% \times \text{balance} + \text{fees} \} 
\]
Identification: Changes in Minimum Payments Differ by Balance

Graphs show a stylized version of typical issuer minimum payment formulas:

\[
\text{minimum payment} = \text{Max} \{ \text{floor}, 1\% \times \text{balance} + \text{interest} + \text{fees}, 2\% \times \text{balance} + \text{fees} \} 
\]
Coefficients of triple difference regressions by balance. Dependent variables are indicators for minimum (left) and actual (right) payments within 10% bins by fraction of balance.
Research Strategy #2: Impact of CARD Act Disclosures
Most Statements Now Include Minimum and Late Payment Warnings

Disclosures Implemented in February, 2010:

Late Payment Warning (we won’t focus on this):

Late Payment Warning: If we do not receive your minimum payment by the date listed above, you may have to pay a $35 late fee and your APRs may be increased up to the Penalty APR of 28.99%.

General minimum payment warning (75% of statements):

Minimum Payment Warning: If you make more than the minimum payment each period, you will pay less in interest and pay off your balance sooner.

Non- or negatively-amortizing minimum payment warning (7% of statements):

Minimum Payment Warning: Even if you make no more charges using this card, if you make only the minimum payment each month we estimate you will never pay off the balance shown on this statement because your payment will be less than the interest charged each month.
More Than Half of Statements Also Include a Three Year Repayment Calculation

Sample Calculation:

<table>
<thead>
<tr>
<th>If you make no additional charges using this card and each month you pay. . .</th>
<th>You will pay off the balance shown on this statement in about. . .</th>
<th>And you will end up paying an estimated total of. . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only the minimum payment</td>
<td>11 years</td>
<td>$4,745</td>
</tr>
<tr>
<td>$103</td>
<td>3 years</td>
<td>$3,712 (Savings = $1,033)</td>
</tr>
</tbody>
</table>

Minimum Warnings Push Payments Up, 3-year Calc. Pushes Payments Down

Alarmingly large standard errors due to issuer heterogeneity

Decrease in delinquencies

Coefficients of triple difference regressions by disclosure eligibility. Left-hand-side (LHS) variables indicate payments within 10% bins by fraction of balance.
Three-year Calculation Pushed Payments Up Slightly for 0.2% of Account-Months
Key Findings: Policy Changes Impact Small Fractions of Accounts in Big Ways, Both Virtuous and Perverse

• Minimum payment floor increases
  – Small increase in delinquencies and 5% overall increase in payments for low-balance account-months due to mechanical effect of change
  – 4% of high-balance account-months move from full to low payments

• CARD Act Disclosures
  – Minimum payment warnings: 1% overall increase in fraction paid
  – Three-year repayment calculation: 1% overall decrease in payments. 0.2% of account-months move to 3-year amount, mostly from the minimum

• Common Patterns: Defaults and Nudges Significantly Impact Behavior
  – Minimum payments and other low-value anchors lead to lower payments overall
  – Warnings that dissuade consumers from the minimum payment show some effectiveness
  – > nudges may not always work in the way we expect or intend
Next Steps: Event Study, Regression Kink, Policy Interactions, and Substitution

• Execution
  – Event study results
  – Difference-in-dynamic-regression-kink (DIRK) specification for formula changes
  – Interactions of disclosure requirements and floor changes
  – Substitution effects – TransUnion appends
  – Heterogeneous effects by FICO, income, etc.

• Building up the theory
  – Rational expectations theories seem like unlikely explanations
  – Similar effects for both real change in payment incentives and disclosure, so liquidity constraints unlikely to be full explanation
  – Effects are persistent, so transitory attention effects unlikely
  – Results point to substantial consumer heterogeneity

• Alternative hypotheses
  – Doesn’t seem to be driven by rate surfers / promotional offers
  – Confounding CARD Act effects of fee decreases, etc?
