San Francisco, CA

(1) The views in this paper are solely the responsibility of the authors and should not be interpreted as reflecting the views of the Federal Reserve Banks of Atlanta or Boston, or of the Federal Reserve System.
Roadmap

- Bring together **4 empirical facts** characterizing the US labor market over the past three decades:

  1. Employment polarization.
  2. Asymmetric polarization for employment and wages.
  3. The emergence of low-skill service jobs.
  4. Rising immigrant employment in low-skill occupations.

- Build 3-country stochastic growth model to rationalize these facts.

- Estimate the model, analyze alternative trade and immigration policy scenarios.
Fact 1: Employment polarization

- Employment became **increasingly concentrated at the tails** of the skill distribution, shrank in the medium-skill occupations (see Acemoglu and Autor, 2011).
Fact 2: Asymmetric polarization, empl. vs. wages

- Wages rose robustly for the high-skilled, but performed poorly in medium-skill occupations, same as employment;

- However, low-skill wages did not match the strong increase in low-skill employment.
Fact 3: The emergence of low-skill service jobs

- Employment gains at the low-end of the skill distribution were mostly due to service occupations (see Autor and Dorn, 2013);

- These hire food service workers, home care aids, child care workers, recreation occupations, gardeners, janitors, etc.
Fact 4: Immigration and low-skill occupations

- Immigrant employment increased mostly in low-skill occupations, whose output is non-tradable:

![Graph showing smoothed changes in employment by skill percentile from 1980 to 2010, comparing non-native and native workers.](image-url)
(1) Offshoring leads to employment polarization.

- As offshoring costs decline, trade in tasks benefits the employment and wages of high-skill workers (whose tasks are sold globally), but harms the medium-skill workers (who only sell domestically);

- Complementarity between goods and services boosts demand for low-skill occupations.

(2) Low-skilled immigration supports employment in services but dampens wages.

- The model generates asymmetric polarization of employment and wages.
(3) **Low-skill immigration encourages training by natives.**

- Low-skill immigration is procyclical like in the data;
- Negative correlation between immigrant and native unskilled employment.

(4) **Reducing the barriers to trade and immigration is welfare-improving.**

- With lower trade barriers, the economy becomes more productive as it specializes in its most efficient tasks;
- Low-skill immigration lowers the price of services and encourages natives to train, thus increasing productivity.
Literature

- Employment polarization:
  - Routine-biased technological change (Acemoglu and Autor, 2011; Autor and Dorn, 2013; Jaimovich and Siu, 2012);
  - Offshoring (Firpo et al., 2011; Goos et al. 2011; Mandelman, 2013).

- Offshoring and immigration:

- Immigration:
  - Secular rise in immigration, concentration on low-skill jobs (Grogger and Hanson, 2008; Peri and Sparber, 2009);
  - Low-skilled immigration and native education (Hunt, 2012).

- Modelling trade and entry with fixed, sunk costs:
  - Firm entry, endogenous exporting (Ghironi and Melitz, 2005 QJE);
  - Endogenous immigration (Mandelman and Zlate, 2012 JME);
  - Skill heterogeneity and endogenous training (Mandelman, 2013);
  - Endogenous offshoring, extensive margin (Zlate, 2012).
Model overview

- Two large economies (Home and Foreign), and a small one (South).

- **Home and Foreign** have two sectors each:
  
  1. **The tradable sector** hires skilled labor:
     
     - Households train endogenously;
     - Training results in a continuum of heterogeneous occupations;
     - Tasks, rather than the final good, are tradable.
  
  2. **The non-tradable/services sector** hires unskilled labor:
     
     - In Home, unskilled labor is a composite of natives and immigrants.

- **South** is the source of unskilled labor migrating to Home:
  
  - Households invest in emigration endogenously.
**Tradable sector, Home**

- **The training of skilled workers:**
  - Every period, households can either allocate “raw” labor to the service sector, or invest in training workers for the tradable sector.
  - Training a new skilled worker requires sunk cost $f_{j,t}$, and results in a new occupation with idiosyncratic productivity $z$ revealed ex-post.
  - Draws $z$ follow a Pareto distribution over the support interval $[1, \infty)$.
  - Thus, training creates a diversity of skilled occupations.

- **Production of tasks:**
  - Each occupation produces a tradable task:
    $$n_t(z) \equiv (X_t \varepsilon_t^T)lz_t.$$  
    - ... where $X_t$ is a permanent world technology shock, and $\varepsilon_t^T$ is an AR(1) country-specific technology shock.
Tradable sector, Home (cont’d)

- **Composite good of tradable sector:**
  - Is a composite of the heterogeneous tasks:
    \[ Y_{T,t} = \left[ \int_{\xi \in \Xi} n_t(z, \xi) \frac{\theta-1}{\theta} d\xi \right]^{\frac{\theta}{\theta-1}}. \]
  - Serves as numeraire, \( P_{T,t} \equiv 1 \).

- **Trade in tasks:**
  - All occupations produce tasks for Home.
  - In addition, some occupations also sell to Foreign.
  - Selling to Foreign requires iceberg cost \( \tau_t \geq 1 \) and fixed cost \( f_{o,t} \equiv \frac{w_{u,t}}{(\epsilon_t^T X_t)} (X_t f_o) \).
  - Shocks to the iceberg trade cost reflect changes in trade barriers:
    \( \tau_t = \epsilon_t^T \tau \).
Tradable sector, Home (cont’d)

- The skill premium:
  - Workers selling their tasks in **Home** obtain:
    \[
    \pi_{D,t}(z) = w_{D,t}(z)n_{D,t}(z) - w_{u,t}l_t.
    \]
  - In addition, workers selling their tasks to **Foreign** also get:
    \[
    \pi_{X,t}(z) = \left( \frac{w_{X,t}(z)}{\tau_t} n_{X,t}(z) - f_{o,t} \right) - w_{u,t}l_t.
    \]
  - Due to the fixed cost, only the most productive occupations sell tasks to Foreign, whose productivity \(z\) is above a threshold:
    \[
    z_{X,t} = \inf\{z : \pi_{X,t}(z) > 0\}.
    \]
Tradable sector, Home (cont’d)

- **Average productivity of skilled workers:**
  
  - All occupations vs. exporting occupations:
    
    $$\bar{z}_D \equiv \left[ \int_1^\infty z^{\theta - 1} dG(z) \right]^{\frac{1}{\theta - 1}} \quad \text{and} \quad \bar{z}_{X,t} \equiv \left[ \frac{1}{1 - G(z_{X,t})} \int_{z_{X,t}}^\infty z^{\theta - 1} dG(z) \right]^{\frac{1}{\theta - 1}}.$$

- **Average skill premium** from selling tasks domestically and abroad:
  
  $$\bar{\pi}_{D,t} = \pi_{D,t}(\bar{z}_D,t) \quad \text{and} \quad \bar{\pi}_{X,t} = \pi_{X,t}(\bar{z}_{X,t}).$$

- **Number of occupations** selling tasks domestically and abroad:
  
  $$N_{D,t} \quad \text{and} \quad N_{X,t}.$$
Non-tradable sector, Home

- **Output of non-tradable sector:**

  - Output is:

    $$ Y_{N,t} = X_t L_{N,t}^A. $$

  - where $X_t$ is the permanent world technology shock;

  - and $L_{N,t}^A$ is a composite of native and immigrant unskilled labor:

    $$ L_{N,t}^A = \left[ \alpha_N (L_{N,t}) \frac{\sigma_{N-1}}{\sigma_N} + (1 - \alpha_N) (L_{i,t}^s) \frac{\sigma_{N-1}}{\sigma_N} \right] \frac{\sigma_N}{\sigma_{N-1}}. $$
**Household, Home**

- **Utility:**  
  \[ E_t \sum_{s=t}^{\infty} \beta^{s-t} c_t^b \left[ \frac{1}{1-\gamma} C_t^{1-\gamma} - a_n X_t^{1-\gamma} \frac{L_t^{1+\gamma_n}}{1+\gamma_n} \right]. \]

- **Cons:**  
  \[ C_t = \left[ (\gamma_c) \frac{1}{\rho_c} (C_T, t) \frac{\rho_{c-1}}{\rho_c} + (1 - \gamma_c) \frac{1}{\rho_c} (C_N, t) \frac{\rho_{c-1}}{\rho_c} \right] \frac{\rho_c}{\rho_{c-1}}. \]

- **Budget constraint:**  
  \[ w_{u, t} L_t + \tilde{\pi}_t N_{D, t} + B_{t-1} = f_{j, t} N_{E, t} + P_t C_t + q_t B_t + \Phi(B_t). \]

- **Average skill income premium:**  
  \[ \tilde{\pi}_t = \left( N_{D, t} \tilde{\pi}_{D, t} + N_{X, t} \tilde{\pi}_{X, t} \right) / N_{D, t}. \]

- **Law of motion for skilled workers:**  
  \[ N_{D, t} = (1 - \delta)(N_{D, t-1} + N_{E, t-1}). \]

- **FOC for training:**  
  \[ f_{j, t} = E_t \sum_{s=t+1}^{\infty} \left[ \beta (1 - \delta) \right]^{s-t} \left( \frac{\zeta_s}{\zeta_t} \right) \tilde{\pi}_s. \]
Household’s Decision Problem:

- Utility: \[ E_t \sum_{s=t}^{\infty} \beta^{s-t} \left[ \frac{1}{1-\gamma} (C_t^s)^{1-\gamma} - a_n^s X_t^{1-\gamma} \frac{(L_{u,t}^s)^{1+\gamma_n}}{1+\gamma_n} \right]. \]

- Budget constraint:
  \[ w_{i,t} L_{i,t}^s + w_{u,t}^s (L_{u,t}^s - L_{i,t}) \geq f_{e,t} L_{e,t}^s + P_t^s C_t^s. \]

- Law of motion, stock of immigrant labor:
  \[ L_{i,t}^s = (1 - \delta_l)(L_{i,t-1}^s + L_{e,t-1}^s); \]

- FOC for emigrant flow \( L_{e,t}^s \):
  \[ f_{e,t} = E_t \sum_{s=t+1}^{\infty} \left[ \beta (1 - \delta_l) \right]^{s-t} \left( \frac{\zeta_{s,t}^s}{\zeta_{s}^s} \right) (w_{i,t} - w_{u,t}^s). \]
Calibration

### Standard parameters for quarterly calibration

- **Discount factor and CRRA coeff.** \( \beta = 0.99, \gamma = 2 \)
- **Frisch elasticity (H, F, S)** \( (1/\gamma_n^H) = 0.75 \)
- **Weight on disutility from labor** \( a_n^H, f = 2.8, a_n^S = 7 \)
- **Share of the trad good (H, F)** \( \gamma_c = 0.75 \)
- **Elast subst trad, nontrad (H, F)** \( \rho_c = 0.44 \)
- **Sunk training cost** \( f_j = 1 \)
- **Destruction rate of skilled jobs (DH 1990)** \( \delta = 0.025 \)
- **Sunk emigr. cost** \( f_e = 8.7 \)
- **Exit rate of immigrant labor** \( \delta_I = 0.025 \)
- **Iceberg trade cost (Novy, 2007)** \( \tau = 1.4 \)

Estimation

- **Shocks:**
  - World technology shock has unit root: \( \log X_t = \log X_{t-1} + \eta_t^X \);
  - Otherwise: \( \log \hat{\varepsilon}_t = \rho \hat{\varepsilon}_{t-1} + \eta_t^\hat{\varepsilon} \), with \( 0 < \rho \hat{\varepsilon} < 1 \), \( \eta \sim N(0, \sigma^\hat{\varepsilon}) \);
  - \( \hat{i} = \{ T, T^*, s, b, b^*, \tau, f_e \} \) denote technology shocks in Home, Foreign and South; demand shocks in Home and Foreign; shock to the iceberg trade cost; and shock to the sunk emigration cost.

  - (a) US, Mexico, rest-of-the-world GDP;
  - (b) U.S. border patrol hours from U.S. Dept. of Homeland Security, with an increase interpreted as an increase in the sunk migration cost;
  - (c) U.S. employment by skill group, divided into Non-Routine Cognitive (high-skilled), Routine Cognitive (medium-skilled), and Non-Routine Manual (unskilled), following Jaimovich and Siu (2012), with Census data.

Notes: For the Inverted gamma function the degrees of freedom are indicated. Results are based on 50,000 simulations of the Metropolis-Hastings algorithm.
Defining key variables

- A few definitions:
  - High-skill ($N_X$) vs. medium skill jobs ($N_M$), where $N_M = N_D - N_X$;
  - Unskilled employment in Home ($L_N$);
  - New skilled jobs ($N_E$, as a measure of "task upgrading");
  - Entry of unskilled immigrant labor ($L_E$).

- Impulse responses:
  - Temporary decline in the iceberg trade cost;
  - Temporary decrease in the sunk cost of immigration;
  - Temporary increase in productivity in the South.
1. Impulse responses

Temporary decline in the iceberg trade cost
1. Impulse responses

Temporary decline in the sunk cost of labor migration

### Unskilled aggregate wage (native & immigrant)

![Graph showing unskilled aggregate wage trends over time](image)
3. Welfare

- Welfare implications of either trade liberalization or decrease in immigration barriers, or both:
  - Either the iceberg trade cost or the sunk immigration cost, or both, are lowered from their benchmark calibration levels ($\tau$ to 1.1; and $f_e$ to 1.0).
  - The model is solved using a second-order approximation around the deterministic steady state.
  - The welfare net gain is obtained as the % of the expected stream of consumption that one should add to the benchmark model case, so that households would be just as well-off as in the counterfactual scenario.
3. Welfare (cont’d)

- Reducing barriers to trade and immigration is welfare-improving:

  - With lower trade barriers, the economy becomes more productive as it specializes in its most productive tasks.

  - With lower immigration barriers, the skilled wage declines, but welfare gains arise from (a) cheaper services and (b) training.

</tbody>
</table>
Conclusions

- 3-country model with endogenous trade in tasks, endogenous immigration of unskilled labor, endogenous training:
  - Easier offshoring gives rise to employment and wage polarization;
  - Unskilled immigration boosts low-skill employment, dampens wages;
  - In turn, native workers undertake training, which is welfare-improving.

- The effects of training and cheaper services should be considered when assessing the welfare impact of immigration.

- Thank you!
