

Fixing Errors in a SNAP: Addressing SNAP Under-reporting to Evaluate Poverty

Liana E. Fox, U.S. Census Bureau

Jonathan Rothbaum, U.S. Census Bureau

Kathryn Shantz, Formerly U.S. Census Bureau

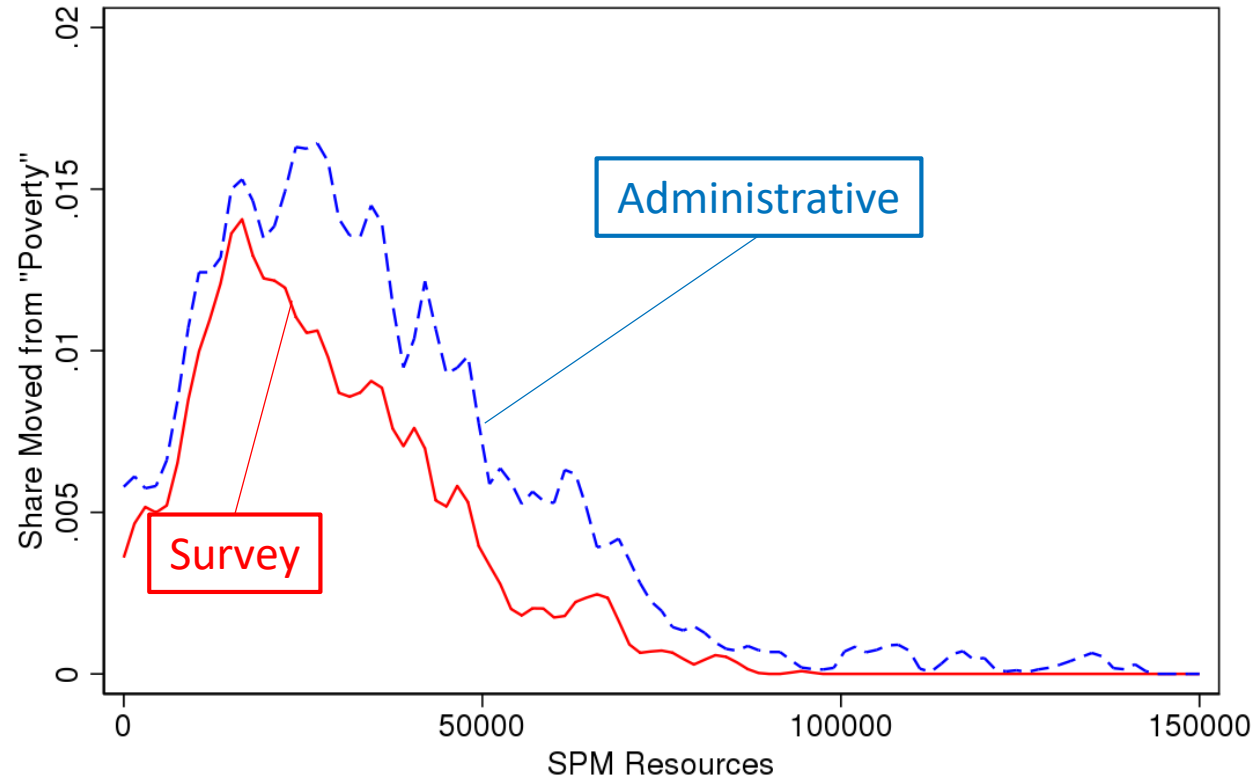

Supplemental Nutrition Assistance Program (SNAP)

- In-kind benefit
- Eligibility requirements
 - Gross income test: 130% of FPG
 - Net income test: 100% of FPG
 - Asset limits
 - Work requirements
- Benefit amount calculation
- Average of 47.6 million recipients each month in 2013
- 79.9 Billion dollars in 2013

Source: United States Department of Agriculture Food and Nutrition Services. 2017. "Supplemental Nutrition Assistance Program (SNAP) Cost of Living Adjustment (COLA) Information." Retrieved September 19, 2017 (<https://www.fns.usda.gov/snap/cost-living-adjustment-cola-information>).

Under-reporting and Who's Affected by SNAP Benefits

Source: U.S. Census Bureau, Current Population Survey, 2014 Annual Social and Economic Supplements (CPS ASEC) and state Supplemental Nutrition Assistance Program (SNAP) administrative records.

Under-reporting Receipt

- A few examples
 - About 40% of SNAP recipients in NY did not report receipt in the CPS (Meyer and Mittag 2015)
 - About 46% of SNAP recipients in AZ, ID, IL, MD, OR, TN, and VA do not report receipt in the CPS ASEC (Stevens et al. 2018)
 - About 16% of SNAP recipients in IL, MD, and VA did not report receipt in the Survey of Income and Program Participation (SIPP) (Colby et al. 2017)

Goal for This Paper

- SNAP data available for some, but not all (or most) states
- Can we use available SNAP data to correct for under-reporting of SNAP benefits nationally?
 - Focus on bias in several sets of estimates
 - Mobility Curves
 - Poverty (SPM)
 - Regression coefficients (SNAP as dependent and independent variable)

Broader Goals/Research Agenda

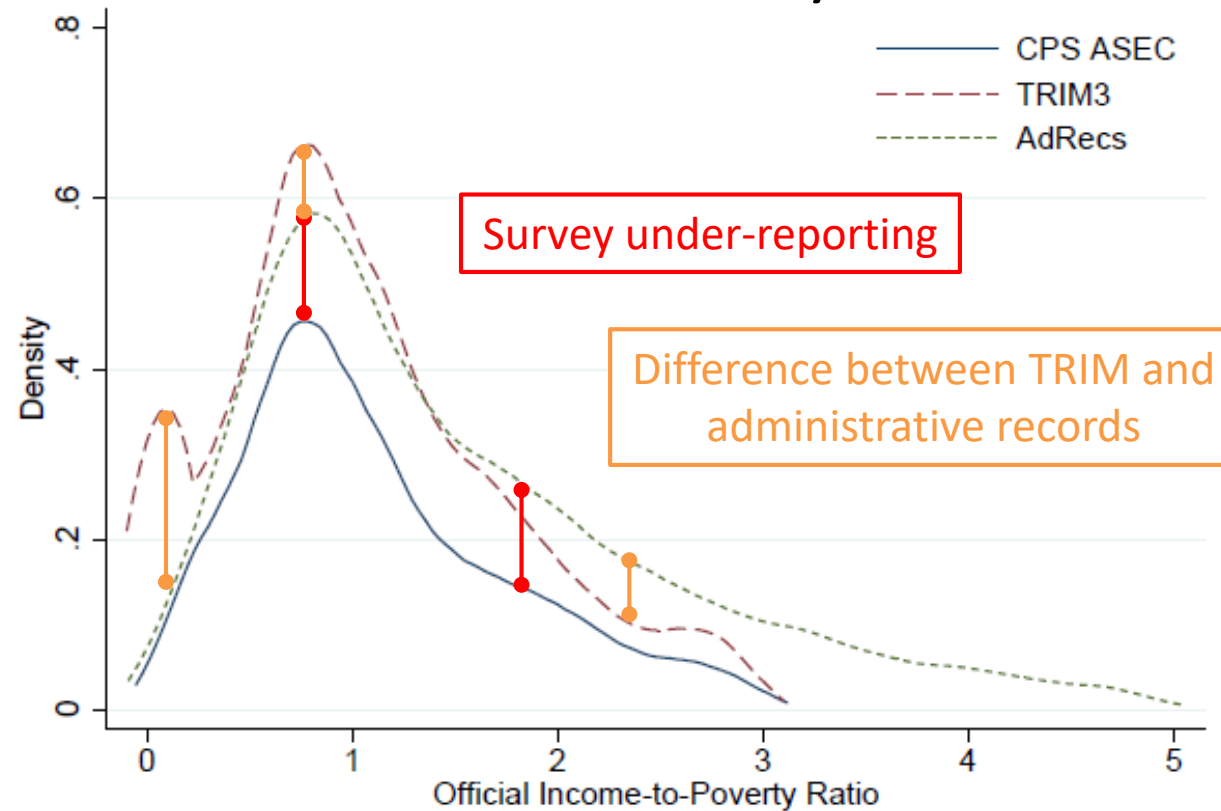

- How should we approach this work?
- Can we use model-based imputation to address under-reporting in surveys when administrative data is not available for all individuals or in all time periods?
 - Correct under-reporting in time t with data available from time $t+/-s$
 - Timely estimates before administrative data is available
 - Historic estimates when administrative data is available in some but not all years
- How to validate the results?

Solutions to Under-reporting

- Direct Replacement
 - Most accurate
 - Limited data availability
- Adjustments Based on External (Unlinked) Data
 - Examples include Urban Institute's TRIM Microsimulation Model and CBO's regression-based adjustments
 - Allows for estimation of all 50 states
 - Potential for mis-allocation based on reported characteristics
- Release Public-use conditional relationships from linked data
 - Mittag (2019)
- Model-Based Imputation
 - Ideally, match conditional distributions, require little understanding of error-correction models (just use the data) and match public aggregates
 - Along with potential benefit of disclosure protection of microdata (essentially synthetic data)

Solutions to Under-reporting

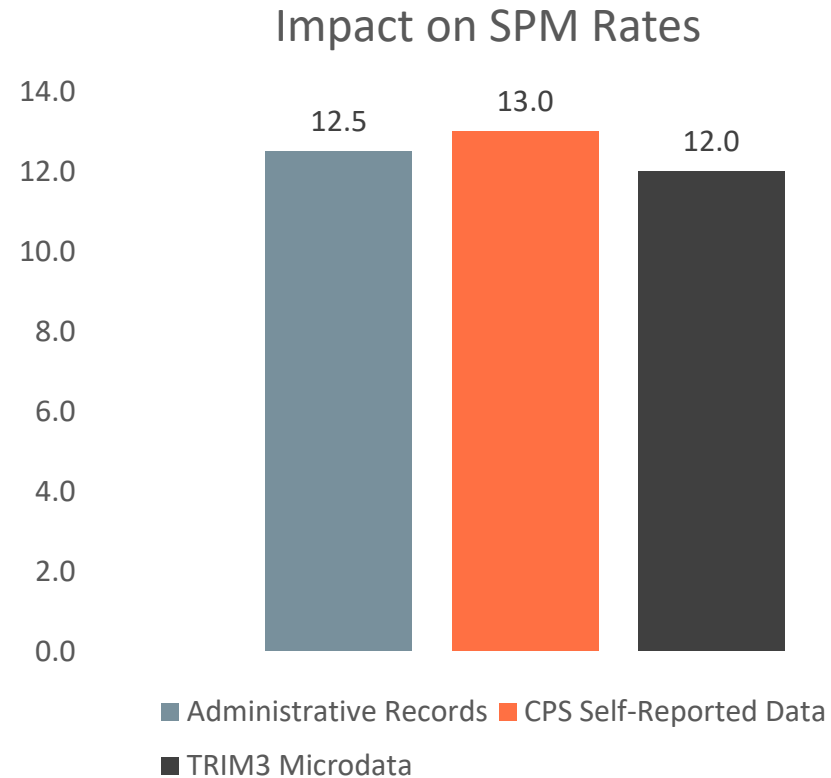

Who Gets Benefits with Survey, TRIM, and Adrecs?

Source: Shantz and Fox, 2019 using the 2010–2016 Annual Social and Economic Supplements (CPS ASEC), Transfer Income Model version 3 (TRIM3), and state Supplemental Nutrition Assistance Program (SNAP) administrative records (AdRecs).

Note: Adjusted using IPW, excluding full line imputes, excluding imputed SNAP receipt and amount, and excluding the top and bottom five percent of observations. The densities have been scaled based on the rates of SNAP receipt. The density for the administrative records curve is one. The unit of analysis is the SPM unit. Values are conditional on positive SNAP benefits in each data source. For information on confidentiality protection, sampling error, non-sampling error, and definitions, see <https://www2.census.gov/programs-surveys/cps/techdocs/cpsmar16.pdf>.

Solutions to Under-reporting SPM for Survey, TRIM, and Adreecs

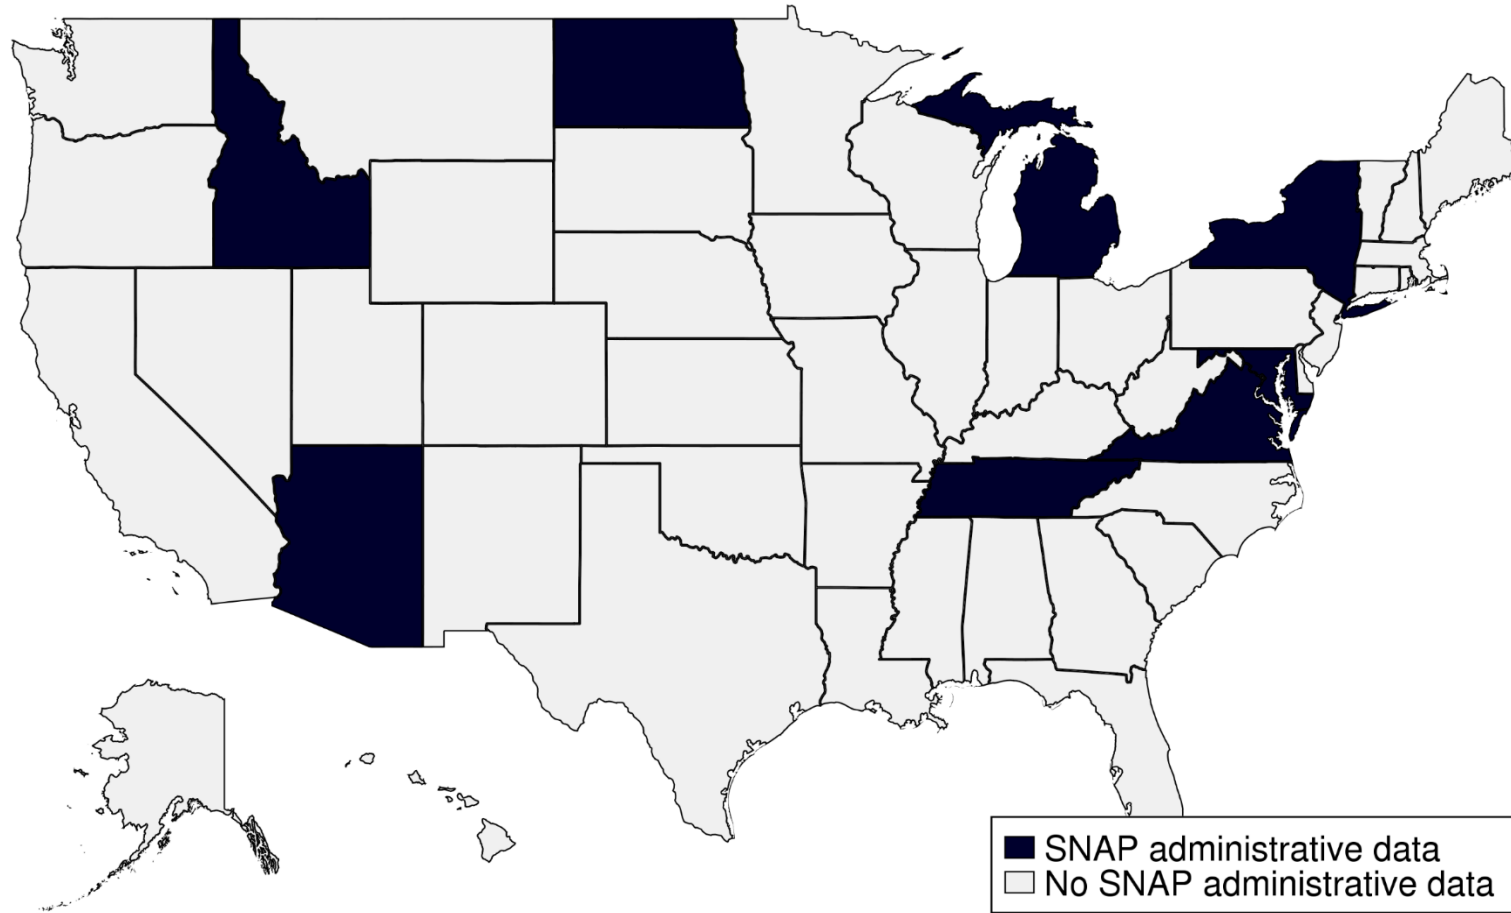

Source: Shantz and Fox, 2018

Data

- Current Population Survey Annual Social and Economic Supplement (CPS ASEC) for 2014
 - Fielded in February through April
 - Asks respondent about SNAP receipt in the previous calendar year
 - Exclude households with non-PIKed head (<10%)
- IRS and SSA income data (1040s, W2s, 1099-R's and DER files)
- Matched to state administrative SNAP records for 8 states
 - Arizona, Idaho, Maryland, Michigan, New York, North Dakota, Tennessee and Virginia
- USDA state-level data on SNAP receipt rates and benefit amounts (monthly averages)

SNAP Administrative Data Used

Descriptive Statistics

	States with Admin Records	Other States	Difference
<i>SNAP State-Level Aggregates (USDA)</i>			
Average monthly share of HHs with SNAP	29.4	26.3	-3.10***
Average Monthly Amount *12	3,192	3,305	113***
Survey SNAP Receipt Rate	14.2	12.5	-1.7**
SNAP Benefits	3,508	3,565	58
Poverty Rate (SPM)	15.5	15.5	0.01
<i>Age</i>			
Under 18 years	22.9	23.8	0.9***
18 to 64 years	62.6	62.1	-0.5*
65 years and older	14.5	14.1	-0.4

Some College, No Degree	17.3	17.9	0.6
Bachelor's Degree or Higher	22.5	21.1	-1.5***

Treat as a Problem of Missing Information

- Want administrative SNAP data from all states
- Only observed in some
- Solved with Imputation
 - Similar to non-response
 - Use observable information to impute plausible administrative SNAP data to households in states where it is not available

Imputation

- Notation
 - O – Characteristics observed for all individuals
 - Includes survey responses, administrative data on W2's, 1040s, 1099Rs
 - Y – SNAP administrative data, $Y = (Y_1, \dots, Y_p)$
 - Observed if $A = 1$ (adrec states), but not if $A = 0$ (non-adrec states)
- Imputation model is based on the conditional joint density
$$f(Y|O, \theta)$$

where $\theta = (\theta_1, \dots, \theta_p)$, and each θ_j is a vector of parameters for each Y_j such as regression coefficients and dispersion parameters

Imputation

- For any imputation model, we must impose assumptions on f and θ to assign plausible values to Y where data are missing
- Underlying assumptions for any imputation model
 - Missing at Random (MAR) – don't need unobservable information to account for missingness

$$f(Y|O, A = 1) = f(Y|O, A = 0)$$

- Proper/Congenial – for a statistic Q (estimate, regression coefficient, etc.), the imputation model is congenial if:*

$$E(\hat{Q}|O, A = 1) = E(\hat{Q}|O, A = 0)$$

* Congeniality also requires the distributions of \hat{Q} to converge so that SE estimates and confidence intervals are valid

Validation – How do we know if the model is any good?

- Cannot test MAR or congeniality assumptions directly
- Indirect test
 - Leave-one-out imputations (LOO) – test imputations against observed administrative in each state s with adrecs, if imputation uses only data from the other adrec states
 - MAR
$$f(Y|O, A = 1, State \neq s) = f(Y|O, A = 1, State = s)$$
 - Congeniality
$$E(\hat{Q}|O, A = 1, State \neq s) = E(\hat{Q}|O, A = 1, State = s)$$

Imputation Process

- Impute (Y)
 1. Household SNAP receipt
 2. Months of receipt
 3. Annual SNAP amount
- Model (f) – predictive mean matching
- SNAP predictors (O) – what goes in the models?
 - The kitchen sink!
 - Survey responses for household head, spouse, and summarized at the household level
 - Tax information
 - W-2 earnings histories
 - 1099-R retirement income (defined-benefit pensions and defined-contribution withdrawals)
 - 1040 income information (AGI, interest, dividends, gross rent, ...)
 - State-level SNAP aggregates

Imputation Example

1. Regress administrative SNAP receipt on predictors
2. Assign expected probability of receipt to all households in sample (in states with and without administrative records)
3. For each household in state **without** SNAP administrative data (recipients), randomly draw actual SNAP receipt from nearest households in an administrative record state (donor)

Expected Probability of SNAP Reciprocity (from regression)

Imputation Process – Too Much Detail

- Practical considerations – O has too many variables
 - Reduce dimensionality of O using variable selection model
 - In practice, this imposes assumptions on θ_j
- θ_j is unknown and must be estimated
 - Uncertainty in $\hat{\theta}_j$ must be accounted for
- Use Bayes' Bootstrap before selection model and predictive mean matching regressions to approximate distribution of $\hat{\theta}_j$ and account for uncertainty
- Create multiple implicates (independent imputations) to calculate uncertainty for any \hat{Q} of interest

Leave-One-Out Imputation

- 8 separate imputation models
 - One for each state s with administrative data
 - Ignore administrative data state s and use other 7 states in imputation
- Validation (some \hat{Q} s)
 - SNAP summary stats
 - Mobility curves
 - SPM rates
 - Regression coefficients

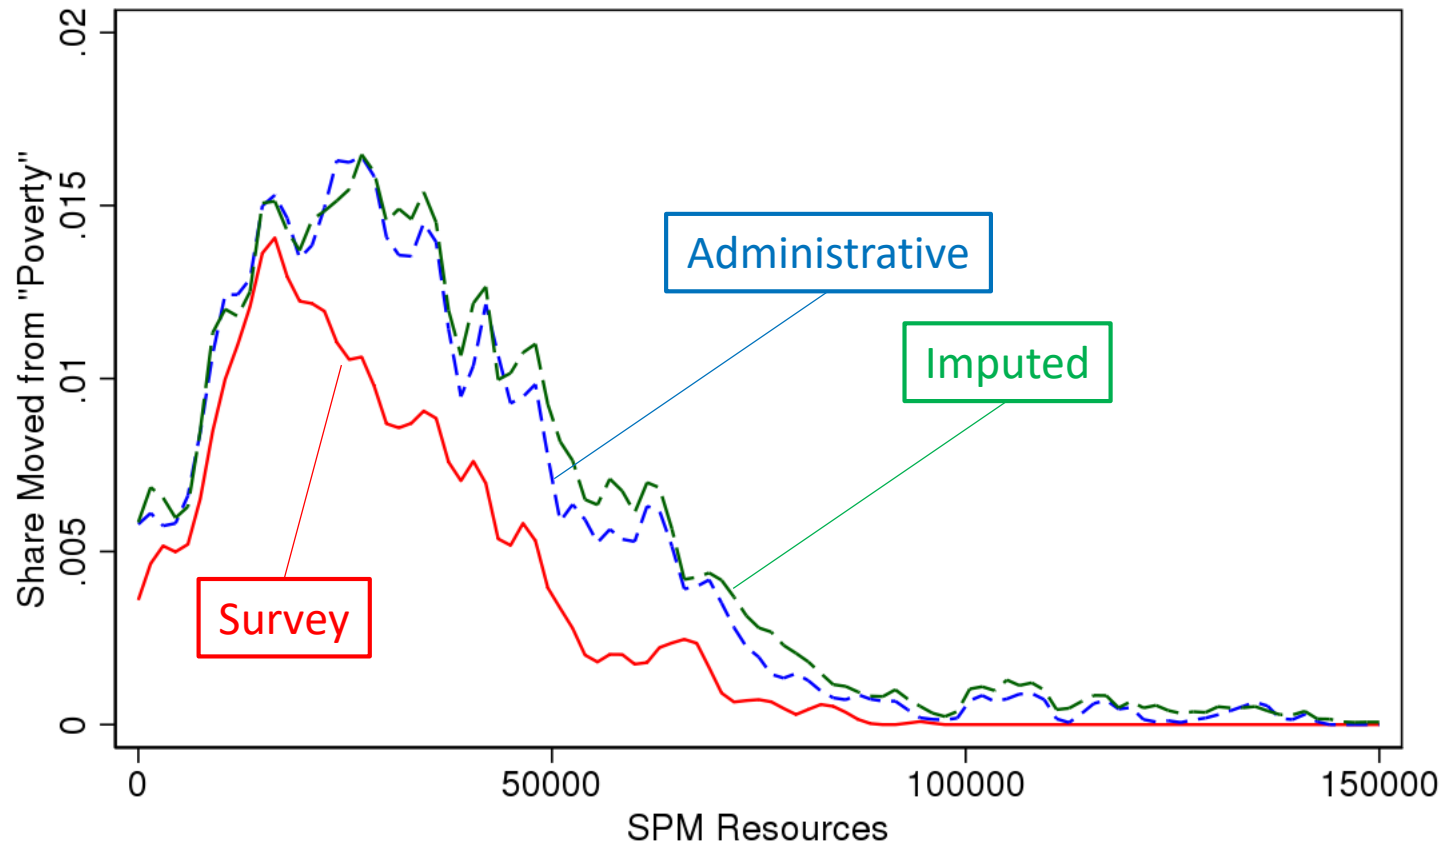

SNAP Validation

Validation Summary

Pooled Leave-one-out Imputation in States with Administrative Data

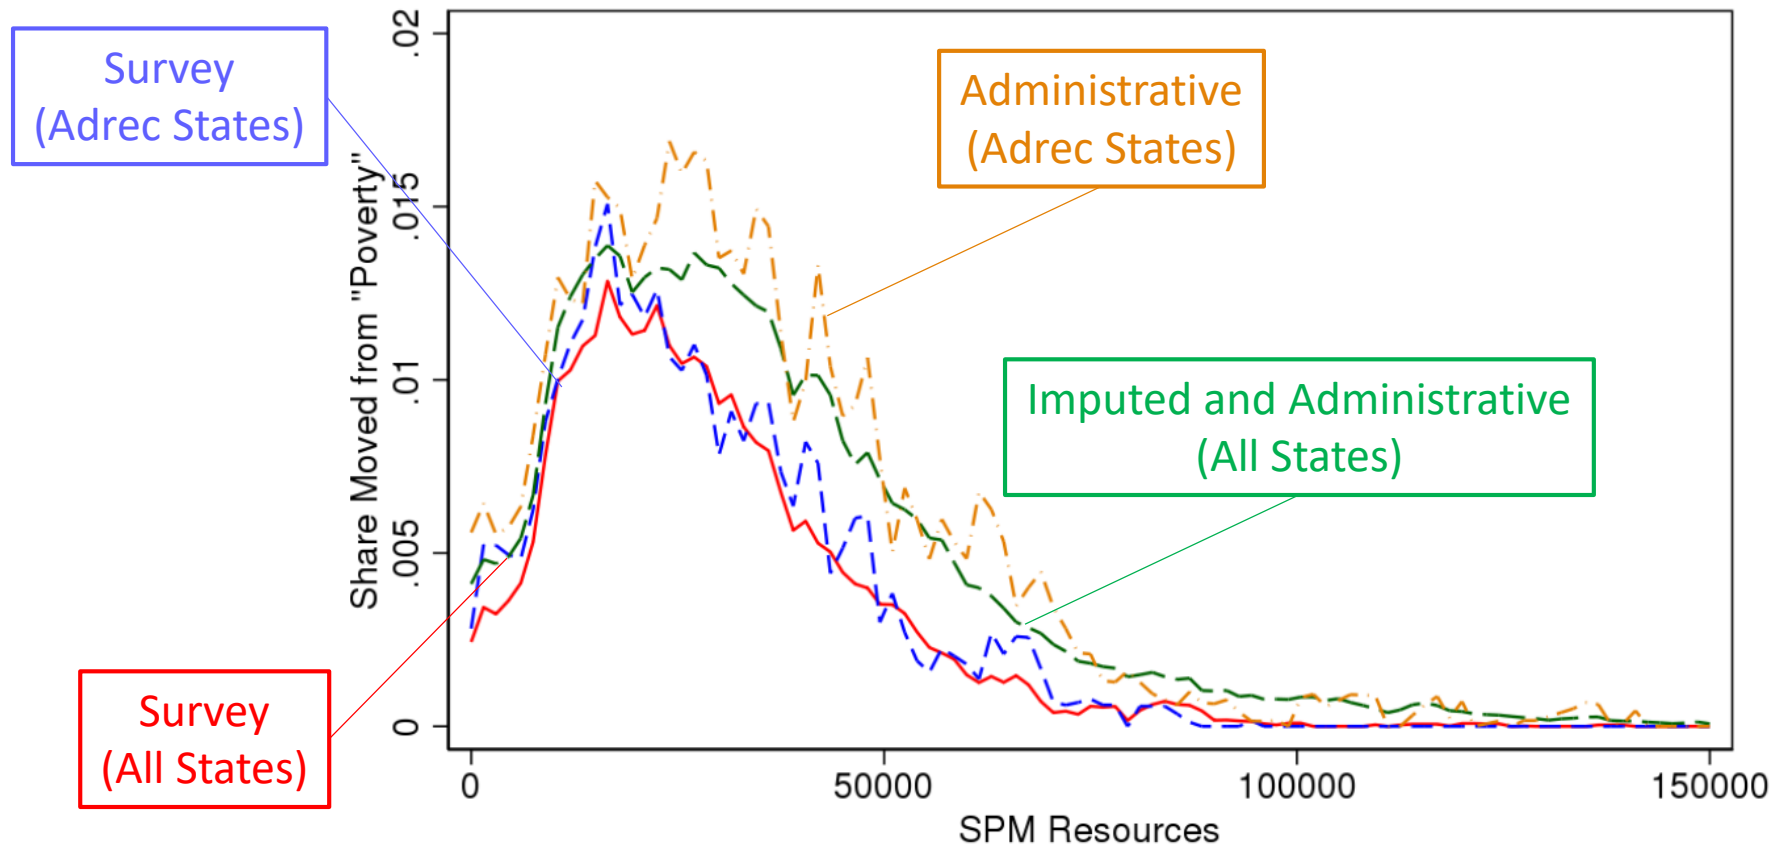

- SNAP Results
 - Very good match overall (and by state) of SNAP receipt
 - Understate benefits conditional on receipt, especially for New York and Virginia
- Mobility Curve
 - Very good match for effect at all SPM resource levels
- SPM
 - Agreement between adrecs and leave-one-out relative to survey
 - Leave-one-out point estimates slightly overstate impact of SNAP, but only one difference from adrec is statistically significant
- Regressions
 - Regressions with SNAP as dependent and independent variable
 - No significant difference between SNAP administrative data and leave-one-out imputes
 - Both differ from survey estimates in earnings regression

National Estimates

- Impute SNAP administrative data for the other 42 states and DC
- Use administrative data for the 8 states where it is available
- Estimate
 - Mobility curve
 - SPM
 - Earnings regression

National Estimate – Mobility Curve

Imputed in Non-adrec States and Administrative Data in Adrec States

National Estimate - SPM

Imputed in Non-adrec States and Administrative Data in Adrec States

Group	Survey Only (Official)	Imputed + Adrecs	Difference
All People	14.58	14.36	-0.22***
Age			
Under 18	15.40	15.38	-0.02
18 to 64	14.35	14.08	-0.28***
65 and older	14.24	13.89	-0.34***
Race/Hispanic Origin			
White	12.75	12.55	-0.20**
Black	24.14	23.56	-0.58
Hispanic	23.84	23.43	-0.41

National Estimate – Earnings Regressions

Imputed in Non-adrec States and Administrative Data in Adrec States

- A handful of coefficients differ between survey-only regressions for samples in Adrec ($A = 1$) and non-adrec ($A = 0$) states
 - Such as for Pacific Islanders, associate's degree holders
- Find similar differences in regressions uses administrative data estimates
- No significant differences in difference-in-difference estimates
 - Difference 1: administrative – survey estimates
 - Difference 2: adrec – non-adrec states

Next Steps

- Add more states
 - Add additional states with data for 2013
- Continue to improve imputation model
 - Include information on rules and requirements in different states and counties
 - County-level SNAP aggregates from USDA
- Expand to other topics where data is available for some individuals/households, but not others (by geography, time, etc.)
- Release the data as a research extract, pending DRB approval.....
