# Instruction Time and Student Achievement: <br> The Moderating Role of Teacher Qualifications 

Katharina Wedel

ifo Institute
Center for the Economics of Education

ASSA 2021 Virtual Annual Meeting
AEA Poster Session (JEL I)
$3^{\text {rd }}-5^{\text {th }}$ January 2021

## Motivation

- Quantity and quality of instruction important for student achievement $\rightarrow$ trade-off:
- Effect of instruction time might depend on instructional and teacher quality
- Instruction time as an input to education production function and interact it with teacher qualifications as a measure for teacher quality
- Recent studies find a positive impact of instruction time on student achievement (Lavy (EJ, 2015), Rivkin \& Schiman (EJ, 2015))
- Effect of instruction time is smaller in developing countries than developed countries
- Effect of instruction time is larger in classrooms with better environments in terms of student behavior

## Research Question

To what extent is the effect of instruction time on student achievement moderated by better qualified teachers?

## Preview of Results

## Data \& Method

- Data: Trends in International Mathematics and Science Study
- Method: Student fixed effects model

## Main Findings

- One hour more instruction time increases student test scores by 0.03 standard deviations
- No effect in developing countries
- Teacher qualifications moderate the effect of instruction time
- Especially in developing countries: instruction time by a high-qualified teacher increases test scores by 0.02 standard deviations

## Data

## Trends in International Mathematics and Science Study (TIMSS)

- Cross-sectional data, wave $2015,4^{\text {th }}$ grade
- Final sample: 115,071 students in 42 countries © Participating Countries
- 2 observations per student (math/science)
- Variables
- Dependent variable: standardized test score in math/science
- Alternative: student's motivation/attitude towards math/science
- Main independent variable: instruction time (hours per week) in math/science (aggregated on school by subject level), reported by teachers
- Further variables: student, teacher, school and country characteristics
- Descriptive Statistics

## Data

## Teacher Qualifications

- Professional development during the last 2 years (yes/no)
- Teacher training with specialization in the relevant subject (yes/no)
- Completed the relevant subject as a main subject with a Bachelor's degree (or higher) (yes/no)
- Experience (in years)

## Empirical Strategy

## Student Fixed Effects Model

- Uses within-student between-subject variation
- Accounts for individual-specific factors (constant within individuals)
- Controls for unobservable student characteristics (e.g. unobserved ability) $\rightarrow$ no heterogeneity in ability, habits or school quality

## Limitations

- Effect of instruction time assumed to be the same for both subjects
- Impact of instruction time is net of spillovers from other subjects

## Empirical Strategy

$$
\begin{equation*}
\text { test score }_{i j k}=\beta_{1} H_{k j}+\beta_{2} X_{i j}+\beta_{3} Q_{l j}+\mu_{i}+\epsilon_{j}+\eta_{k}+u_{i j k} \tag{1}
\end{equation*}
$$

- test score ${ }_{i j k}$ : test score of student $i$ in school $j$ in subject $k(k \in$ math, science)
- $\mathrm{H}_{k j}$ : instruction time (in hours) in school $j$ in subject $k$
- $X_{i j}$ : student characteristics of student $i$ in school $j$ and teacher characteristics
- $Q_{l j}$ : teacher characteristics of teacher / in school $j$
- $\mu_{i}$ : student fixed effects
- $\epsilon_{j}:$ unobserved school characteristics
- $\eta_{k}$ : unobserved subject-specific characteristics
- $u_{i j k}$ : error term

## Empirical Strategy

- $Q_{l j}$ : teacher qualifications of teacher I in school $j$
- Professional development
- Teacher education with specialization
- Major in the relevant subject and Bachelor (or higher) degree
- Experience

## Results - Instruction Time

## Table 1: Baseline Results

| VARIABLES | $\begin{gathered} (1) \\ \text { test score } \end{gathered}$ | $\begin{gathered} (2) \\ \text { test score } \end{gathered}$ | (3) <br> test score |

| effect for high qualification | $0.016^{* *}$ | 0.007 | $0.024^{* * *}$ | -0.010 |
|  | $(0.00632)$ | $(0.00691)$ | $(0.00711)$ | $(0.00776)$ |

> | Clustered standard errors at school level in parentheses |
| :---: |
| ${ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,{ }^{*} \mathrm{p}<0.1$ |

Notes: Sample restricted to developing countries. The dependent variable is a student's test score in math/science. Instruction time is aggregated on school-by-subject level. Regressions run as in equation 2. PD stands for professional development. Effect for high qualification shows the coefficient on instruction time when the respective teacher qualification (PD, education specialization, major degree, experience) equals 1 .

## Robustness Checks

- Within-teacher specification (same teacher in both subjects)
- Country outlier (including interaction with teacher qualifications)
- Non-linear effect? (including squared instruction time)
- Tracking?
- Question: "As a general school policy, is student achievement used to assign fourth grade students to classes?"
- Instruction time as reported by teachers (not aggregated on school-by-subject level)
- Schools in remote areas
- Students cannot choose between different schools

## Conclusion

- Positive effect of instruction time on test scores
- One hour more instruction time increases test scores by 0.03 standard deviations
- Similar in magnitude to previous literature
- Teacher qualifications moderate effect of instruction time on test scores
- Especially in developing countries, teacher qualifications are important: instruction time by a high-qualified teacher increases test scores by 0.02 standard deviations

Clustered standard errors at school level in parentheses

$$
{ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,^{*} \mathrm{p}<0.1
$$

Notes: The dependent variable is a student's test score in math/science. Instruction time is aggregated on school-by-subject level in column 1 to 5 , not in column 6. Regressions run as in equation 1. Tracking:yes indicates that only the sub-sample of observations where tracking is used as school policy is used. remote: yes indicates that only the sub-sample of observations in remote areas is used.

## Questionnaire - Having a degree \& Specialization

ATBG04 What is the highest level of formal education you have completed?

| ATBG05AA | During your <post-secondary> education, what was your major or main area(s) of <br> study? Education-Primary/Elementary |
| :--- | :--- |
| ATBG05AB | During your <post-secondary> education, what was your major or main area(s) of <br> study? Education-Secondary |
| ATBG05AC | During your <post-secondary> education, what was your major or main area(s) of <br> study? Mathematics |
| ATBG05AD | During your <post-secondary> education, what was your major or main area(s) of <br> study? Science |
| ATBG05AE | During your <post-secondary> education, what was your major or main area(s) of <br> study? <language of test> |
| ATBG05AF | During your <post-secondary> education, what was your major or main area(s) of <br> study? Other |
| ATBG05BA | If your major or main area of study was education, did you have a <br> <specialization> in any of the following? Mathematics |
| ATBG05BBIf your major or main area of study was education, did you have a <br> <specialization> in any of the following? Science |  |
| ATBG05BCIf your major or main area of study was education, did you have a <br> <specialization> in any of the following? Language/reading |  |
| ATBG05BD If your major or main area of study was education, did you have a |  |
| <specialization> in any of the following? Other subject |  |

## Questionnaire - Professional Development

| ATBM09A | In the past two years, have you participated in professional development in any of <br> the following? Mathematics content |
| :--- | :--- |
| ATBM09B | In the past two years, have you participated in professional development in any of <br> the following? Mathematics pedagogy/instruction |
