

# **Educated and Alone? How Gender Imbalances in Higher Education Shape the Marriage Market**

---

**Mahla Shourian, University of Oklahoma**

**Pallab Ghosh, University of Oklahoma**

# Motivation

## 1. A Growing Gender imbalance in Educational Attainment

In recent decades, the college graduation rate among men has risen more slowly compared to women, leading to a growing gap in educational attainment.

The ratio of men to women in the 25-35 age group for high school dropouts and those with a high school diploma or some college education has fluctuated, while the ratio for college-educated individuals has consistently decreased since the 1970s.

“The rising gender gap in higher education might turn out to be one of the most transformative trends of our time.”

Justin Wolfers:  
The New York Times, 2021

Among 25-34 year-olds, women are more likely to have a degree than men in all 38 countries that are members of the Organization for Economic Cooperation and Development.

## 2. The Rise in Assortative Mating

That is, people are more likely to marry someone of the same educational level today than in the past.

1. The difference between the actual and random matches in these cells is always positive, reflecting positive assortative mating.

2. the extent of positive assortative mating has become stronger over time.

Source: Greenwood, Jeremy, Nezih Guner, Georgi Kocharkov, and Cezar Santos. 2016. "Technology and the Changing Family: A Unified Model of Marriage, Divorce, Educational Attainment, and Married Female Labor-Force Participation." *American Economic Journal: Macroeconomics*, 8 (1): 1–41.

- the fraction of all matches that occur in the specified category.
- (The fraction that would occur if matching occurred randomly.)

Using data from Germany, Pestel (2021) analyzes how changes in the student sex ratio impact marriage market outcomes for university graduates: a higher own-gender share within the field of study reduces marriage market opportunities for women, while the opposite is true for men.

**“A higher share of women in university means that more women are competing for fewer men.”**

# Question

**This research aims to investigate how the decreasing proportion of college-educated men relative to college-educated women affects the marriage rate of college-educated women.**

Graduation Rate by gender vs Marriage Rate of coll-educated women:Age group 25-35

As the pool of “marriageable” men with similar educational attainment shrinks, marriage formation among women with college degrees may be negatively impacted.

# Hypothesis

- To establish causality, the analysis will exploit the variation in state funding cuts as an exogenous shock to the cost of higher education.
- The most significant reductions in state funding for colleges happened between 2001 and 2004, with further declines following the Great Recession.
- Reduced state funding often leads to increased tuition fees at public universities.
- We believe that reductions in state funding for colleges leads to a higher reduction in the enrolment/graduation of men compared to women.

- The outcome variable will be the marriage rates of college-educated women, analyzed in relation to the ratio of college educated men to college educated women.

$$\text{Marriage Rate of College Educated Women} = \frac{\text{Number of married college educated women aged 25 – 35}}{\text{Number of college educated women aged 25 – 35}}$$

$$\text{Gender Ratio in Higher Education} = \frac{\frac{\text{Number of college educated men aged 25 – 35}}{\text{Total number of men aged 25 – 35}}}{\frac{\text{Number of college educated women aged 25 – 35}}{\text{Total number of women aged 25 – 35}}}$$

# Data

## **❑ The Integrated Postsecondary Education Data System (IPEDS)**

- IPEDS gathers information from every college, university, and technical and vocational institution that participates in the federal student financial aid programs.
- data on enrollments, program completions, graduation rates, faculty and staff, finances, institutional prices, and student financial aid.

## **❑ Marriage rate data for college-educated women will be drawn from surveys such as the American Community Survey (ACS) and the Current Population Survey (CPS).**

# State Level Results

# Next Steps

## ➤ **Utilize IPEDS Data**

Leverage the Integrated Postsecondary Education Data System (IPEDS) to examine variations in state funding cuts, treating these as exogenous shocks to the cost of higher education.

## ➤ **Conduct Analysis at the Commuting Zone Level**

Perform the analysis at the commuting zone level to capture localized impacts and improve the granularity of results. This approach enables a better understanding of the regional effects of funding cuts on educational and marriage outcomes.
