TABLE A1: KEYWORD ALLOCATION

| Rank | Original Keyword | English Translation | Sector | | | | | | | | | | | | | | | | | | |
|-------|--------------------------|-------------------------------------|--------|----|----|----|----|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|--------------|--------------|
| | | | Freq. | 1. | 2. | 3. | 4. | 5. | 6. | 7. | 8. | 9. | 10. | 11. | 12. | 13. | 14. | 15. | 16. | Other Sector | Unclassified |
| 1. | Objekt | Object | 19,786 | | | | | | | | | | | | | | | | | ✓ | |
| 2. | Militäertechnik | Military Technology | 12,471 | | | | | | | | | | | | | | | | | ✓ | |
| 3. | Elektronik | Electronics | 11,807 | | | | | | | | | | | | | | | | | ✓ | |
| 4. | Elektrotechnik | Electrical Engineering | 11,307 | | | | | | | | | | | | | | | | | ✓ | |
| 5. | S | - | 10,968 | | | | | | | | | | | | | | | | | ✓ | |
| 6. | Austausch_Ausgeschlossen | Exchange Precluded | 10,419 | | | | | | | | | | | | | | | | | ✓ | |
| 7. | Mikroelektronik | Microelectronics | 9,666 | | | | | | | | | | | | | | | | | ✓ | |
| 8. | Software | Software | 9,645 | | | | | | | | | | | | | | | | | ✓ | |
| 9. | Rechnertechnik | Computer Science | 9,046 | | | | | | | | | | | | | | | | | ✓ | |
| 10. | Nachrichtentechnik | Communications Engineering | 7,868 | | | | | | | | | | | | | | | | | ✓ | |
| 11. | Chemie | Chemistry | 7,519 | | | | | | | | | | | | | | | | | ✓ | |
| 12. | R | - | 5,734 | | | | | | | | | | | | | | | | | ✓ | |
| 13. | Anwendung | Application | 5,331 | | | | | | | | | | | | | | | | | ✓ | |
| 14. | NA | - | 5,312 | | | | | | | | | | | | | | | | | ✓ | |
| 15. | Hardware | Hardware | 4,326 | | | | | | | | | | | | | | | | | ✓ | |
| 16. | Technologie | Technology | 3,734 | | | | | | | | | | | | | | | | | ✓ | |
| 17. | MT | - | 3,582 | | | | | | | | | | | | | | | | | ✓ | |
| 18. | EDV | Electronic Data Processing | 3,416 | | | | | | | | | | | | | | | | | ✓ | |
| 19. | Kleinrechner | Microcomputer | 3,343 | | | | | | | | | | | | | | | | | ✓ | |
| 20. | Programm | Program | 3,335 | | | | | | | | | | | | | | | | | ✓ | |
| 21. | Beschreibung | Description | 3,166 | | | | | | | | | | | | | | | | | ✓ | |
| 22. | Umweltschutz | Environment Protection | 3,085 | | | | | | | | | | | | | | | | | ✓ | |
| 23. | Datentechnik | Data Processing Technology | 3,060 | | | | | | | | | | | | | | | | | ✓ | |
| 24. | Muster | Pattern | 3,034 | | | | | | | | | | | | | | | | | ✓ | |
| 25. | EDVA | Electronic Data Processing Facility | 3,018 | | | | | | | | | | | | | | | | | ✓ | |
| 26. | Metallurgie | Metallurgy | 2,992 | | | | | | | | | | | | | | | | | ✓ | |
| 27. | Optik | Optics | 2,922 | | | | | | | | | | | | | | | | | ✓ | |
| 28. | Personalcomputer | Personal Computer | 2,722 | | | | | | | | | | | | | | | | | ✓ | |
| 29. | IBM | IBM | 2,635 | | | | | | | | | | | | | | | | | ✓ | |
| 30. | Kernkraftwerk | Nuclear Power Plant | 2,584 | | | | | | | | | | | | | | | | | ✓ | |
| . | . | . | . | | | | | | | | | | | | | | | | | | |
| 1991. | Schwermetall | Heavy Metal | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1992. | Schwingquarz | Oscillating Crystal | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1993. | Sonnan | Sonnan | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1994. | Temperaturverteilung | Temperature Distribution | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1995. | Turbinenschaufel | Turbine Blade | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1996. | Umkehrosmose | Reverse Osmosis | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1997. | Verformung | Deformation | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1998. | Verkehr | Traffic | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 1999. | Waermedaemmung | Heat Insulation | 57 | | | | | | | | | | | | | | | | | ✓ | |
| 2000. | Wolfram | Wolfram | 57 | | | | | | | | | | | | | | | | | ✓ | |

Note: This table shows the 2,000 most common keywords in TDB11 and their sectoral allocation. List of sectors: 1. Food and Tobacco, 2. Textiles and Clothing, 3. Leather Products, 4. Woodworking, 5. Paper, Printing, and Publishing, 6. Furniture, Jewelry, and Music Instruments, 7. Coking and Petroleum, 8. Chemicals, 9. Rubber and Plastics, 10. Glass, Ceramics, and other non-Metallic Minerals, 11. Metallic Minerals, 12. Metalworking, 13. Machine Building, 14. Office Appliances, Computers, and Electronics, 15. Mining, 16. Utilities-Energy and Water Supply.

TABLE A2: ALLOCATION PROCEDURE - EXAMPLES

| ID | Keywords (Original) | Keywords (English) | Assigned Sector(s) |
|---|--------------------------|---------------------------|---|
| Example 1: | | | |
| 2388127 | ELEKTROCHEMIE | Electrochemistry | Chemicals, Electronics |
| 2388127 | OPTOELEKTRONIK | Optoelectronics | Electronics |
| 2388127 | MIKROELEKTRONIK | Microelectronics | Electronics |
| 2388127 | PLASMAPHYSIK | Plasma Physics | Electronics |
| 2388127 | OBJEKT | Object | Electronics |
| 2388127 | CHEMIE | Chemistry | Chemicals |
| 2388127 | KRISTALLZUECHTUNG | Crystal Growing | Chemicals |
| → Baseline (unweighted): Chemicals 1, Electronics 1 | | | |
| → Adjusted (weighted): Chemicals 3/7, Electronics 4/7 | | | |
| Example 2: | | | |
| 1674509 | ELEKTROKERAMIK | Electrical Ceramic | |
| 1674509 | KERAMIK | Ceramics | Glass, Ceramics, and Non-Metallic Minerals |
| 1674509 | TITAN | Titan | Chemicals |
| 1674509 | PIEZOKERAMIK | Piezoceramics | Glass, Ceramics, and Non-Metallic Minerals |
| → Baseline (unweighted): Glass, Ceramics, and Non-Metallic Minerals 1, Chemicals 1 | | | |
| → Adjusted (weighted): Glass, Ceramics, and Non-Metallic Minerals 2/3, Chemicals 1/3 | | | |
| Example 3: | | | |
| 2388709 | OBJEKT | Object | |
| 2388709 | CHEMIE | Chemistry | Chemicals |
| 2388709 | AUSTAUSCH_AUSGESCHLOSSEN | Non-returnable | |
| 2388709 | VERNETZUNG | Networking | |
| 2388709 | EPOXIDHARZ | Epoxy Resin | Chemicals, Rubber and Plastics, Electronics |
| → Baseline (unweighted): Chemicals 1, Rubber and Plastics 1, Electronics 1 | | | |
| → Adjusted (weighted): Chemicals 1/2, Rubber and Plastics 1/4, Electronics 1/4 | | | |
| Example 4: | | | |
| 2383885 | MASCHINENBAU | Machine Building | Machine Building |
| 2383885 | OBERFLAECHENBESCHICHTUNG | Surface Coating | |
| 2383885 | HYDRAULIKANLAGE | Hydraulic System | |
| 2383885 | FARBSPRITZROBOTER | Painting Robot | |
| 2383885 | AUTOMOBILBAU | Automobile Manufacturing | Motor Vehicles |
| 2383885 | LACKIERANLAGE | Paint-spray Line | |
| 2383885 | MANIPULATOR | Manipulator | Machine Building |
| → Baseline (unweighted): Machine Building 1, Motor Vehicles 1 | | | |
| → Adjusted (weighted): Machine Building 2/3, Motor Vehicles 1/3 | | | |
| Example 5: | | | |
| 1339125 | WEHRHYGIENE | Military Hygiene | |
| 1339125 | WEHRMEDIZIN | Military Medicine | |
| 1339125 | KOMBINATIONSSCHADEN | Combined Handicaps | |
| 1339125 | THERAPIE | Therapy | |
| 1339125 | INFEKTIONSPROPHYLAXE | Infection Prophylaxis | |
| 1339125 | STRAHLENSCHUTZ | Radiation Protection | |
| 1339125 | OBJEKT | Object | |
| → Baseline (unweighted): - | | | |
| → Adjusted (weighted): - | | | |
| Example 6: | | | |
| 1743402 | BAGGER | Excavator | |
| 1743402 | NA | NA | |
| 1743402 | TAGEBAUAUSRUESTUNG | Open Pit Mining Equipment | |
| 1743402 | KONSTRUKTION | Construction | |
| 1743402 | SCHAUFELRADBAGGER | Bucket-wheel Excavator | |
| → Baseline (unweighted): - | | | |
| → Adjusted (weighted): - | | | |

Note: This table provides six examples of how pieces of information are matched to sectors. Missing entries in the final column indicate that the corresponding keyword was either not classifiable (such as "Object" in example 1 or "Non-returnable" in example 3), not pertaining to any of the 16 sectors included in our analysis (such as "Military Hygiene" in example 5), or not among the 2,000 most frequently occurring keywords in the database (such as "Electrical Ceramic" in example 2, "Painting Robot" in example 4, or "Excavator" in example 6). Examples 1 and 2 have good coverage as almost all keywords could be assigned to one or more sectors, examples 3 and 4 have moderate coverage, and examples 5 and 6 belong to the 18.6% of pieces of information that are not described by any sector-specific keyword and thus not accounted for in the empirical analysis.

TABLE A3: TOP 20 INFORMANTS, 1968 - 1989

| Registration No. | Code Name | Pieces of Information | Reliability | First Active Year | Last Active Year |
|------------------|-----------------|-----------------------|-------------|-------------------|------------------|
| (1) | (2) | (3) | (4) | (5) | (6) |
| XV/6603/80 | FROEBEL | 5,344 | A | 1982 | 1989 |
| XV/2768/76 | SEEMANN | 4,902 | A | 1970 | 1988 |
| XV/1967/64 | KOREN | 4,257 | A | 1973 | 1987 |
| XV/78/71 | ZENTRUM | 3,373 | A | 1969 | 1989 |
| XV/436/70 | IRMGARD KRUEGER | 3,288 | A | 1970 | 1989 |
| | DR. GROSZ | 2,630 | A | 1969 | 1974 |
| XV/1754/68 | RING | 2,485 | A | 1968 | 1978 |
| XV/2550/74 | HERZOG | 2,239 | A | 1974 | 1989 |
| XV/2234/74 | JUERGEN | 1,631 | A | 1969 | 1987 |
| XV/2110/67 | OPTIK | 1,472 | A | 1969 | 1989 |
| XV/4070/70 | LORENZ | 1,374 | B | 1971 | 1979 |
| XV/3074/78 | SCHNEIDER | 1,347 | B | 1969 | 1989 |
| XV/6412/82 | PICHLER | 1,157 | A | 1982 | 1989 |
| XV/238/68 | RITTER | 1,123 | B | 1969 | 1986 |
| XV/47/68 | ERICH | 1,068 | A | 1971 | 1988 |
| XV/450/86 | ZELTER | 1,065 | B | 1984 | 1989 |
| XV/3/75 | HARTMANN | 1,043 | A | 1969 | 1981 |
| XV/2001/73 | JACK | 944 | A | 1973 | 1987 |
| XIV/14/69 | ALFRED | 890 | A | 1970 | 1989 |
| XV/1508/75 | WEBER | 867 | A | 1969 | 1980 |

Note: Reliability is measured by the mode of the recorded assessments. An "A" denotes "reliable" (*zuverlässig*), a "B" denotes "trustworthy" (*vertrauenswürdig*), a "C" denotes "not checked" (*nicht überprüft*), a "D" denotes "questionable" (*fragwürdig*), and an "E" denotes "double agent" (*Doppelagent*). Only values A, B and C appear in the data.

Note: Summary statistics computed for 3-year overlapping observations for the period 1970 to 1989 apart from the capital shares for East Germany which are based on the period 1995 to 2006 and refer to the aggregate capital shares in the ten new EU member states who joined in May 2004. Imports are cumulated over the last 3 years and measured in million dollars at constant 1995 prices. Output is measured in million euros at constant 1995 prices. Workers are measured in 1,000 so that output per worker is measured in 1,000 euros at constant 1995 prices. The number of observations is 15 for each industry (20 for the West German capital share, 12 for the East German capital share).

TABLE A5: NON-OVERLAPPING OBSERVATIONS

| | Log TFP | | | Log Output per Worker | | |
|-----------------------|-------------------|-------------------|-------------------|-----------------------|-------------------|-------------------|
| | Baseline spec | Patents gap | Lagged gap | Baseline spec | Patents gap | Lagged gap |
| | (1) | (2) | (3) | (4) | (5) | (6) |
| Espionage | -0.029 (0.023) | -0.041 (0.023) | -0.053 (0.016) | -0.026 (0.020) | -0.041 (0.022) | -0.042 (0.022) |
| Patents Gap | | 0.105 (0.030) | -0.006 (0.035) | | 0.137 (0.032) | 0.045 (0.042) |
| Log TFP Gap | | | | -0.544 (0.128) | | |
| Log Output/Worker Gap | | | | | | -0.478 (0.139) |
| P-value WB | 0.405 | 0.264 | 0.050 | 0.363 | 0.194 | 0.269 |
| R-squared | 0.36 | 0.41 | 0.59 | 0.32 | 0.40 | 0.54 |
| Observations | 80 | 80 | 80 | 80 | 80 | 80 |

Note: Sample based on 3-year intervals and non-overlapping observations for the years 1973, 1976, 1979, 1982, and 1985. All regressions include time- and sector-specific fixed effects. Observations are weighted by the average number of workers in a sector. The dependent variable is the change in the log TFP gap between West and East Germany over the period t to $t+3$ in columns (1) to (3) and the change in the log output per worker gap over the period t to $t+3$ in columns (4) to (6). Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

| Observations | 192 | 192 | 192 | 192 | 192 | 192 |

Sample based on 3-year intervals and overlapping observations for the period 1970 to 1989. All regressions include time- and sector-specific fixed effects. Observations are weighted by the average number of workers in a sector. The dependent variable is the change in the log output per worker gap between West and East Germany over the period t and t+3 in columns (1) and (4) and the change in log output per worker between t and t+3 in West and East Germany in columns (2) and (5) and (3) and (6), respectively. The instrumental variables are described in Section V A. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

| F-stat | 72.6 | 60.6 | 30.1 | 4.9 | 13.6 | 69.0 | 36.5 | 29.8 |
| Observations | 192 | 192 | 192 | 180 | 192 | 189 | 192 | 192 |

Note: Sample based on overlapping observations for the period 1970 to 1989. All regressions include time- and sector-specific fixed effects, the patents gap and the initial log output per worker gap as additional regressors. Observations are weighted by the average number of workers in a sector (apart from columns (2) and (3)). The dependent variable is the change in the log output per worker gap between West and East Germany over the period t to $t + x$, where $x \in \{1, 3, 5\}$. Column (1) restates our main results from column (6) of Table 2. In column (2), observations are weighted by the average sector-specific gross value added. In column (3), observations are unweighted. In column (4), we exclude the IT sector from the estimation sample. In column (5), we include sector-specific linear time trends in the specification. In column (6), we include the gap in the sector-specific import/output ratio between West and East Germany as an additional control variable. In column (7), we weight each piece of information according to the number of categorized keywords assigned to each sector. In column (8), we use machine learning methods to assign pieces of information to industry sectors. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

Note: Sample based on annual intervals for the period 1970 to 1989. All regressions include time- and sector-specific fixed effects, the patents gap and the initial log TFP gap (upper panel) or log output per worker gap (lower panel) as additional regressors. Observations are weighted by the average number of workers in a sector (apart from columns (2) and (3)). The dependent variable is the change in the log TFP gap (upper panel) or log output per worker gap (lower panel) between West and East Germany over the period t to t+1. The instrumental variables are described in Section V A. Column (1) restates our main results from column (3) of Table 2. In column (2), observations are weighted by the average sector-specific gross value added. In column (3), observations are unweighted. In column (4), we exclude the IT sector from the estimation sample. In column (5), we include sector-specific linear time trends in the specification. In column (6), we include the gap in the sector-specific import/output ratio between West and East Germany as an additional control variable. In column (7), we weight each piece of information according to the number of categorized keywords assigned to each sector. In column (8), we use machine learning methods to assign pieces of information to industry sectors. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

Note: Sample based on 3-year intervals and overlapping observations for the period 1970 to 1989. The functional form of the inflow variable, which is also applied to the patents gap measure, is reported in the column heading. S_t/L_t is measured in pieces of information per 100 workers, S_t in 1,000 pieces of information and $\ln(S_t)$ in log pieces of information. All regressions include time- and sector-specific fixed effects. Observations are weighted by the average number of workers in a sector. The dependent variable is the change in the log TFP gap between West and East Germany over the period t to $t+3$. In the second panel, the instrument is constructed as $\sum_{i \in 1970} \theta_{i,70} \lambda_{ij,70} \sum_{s=t-2}^t I_s$, where $\theta_{i,70}$ is the share of the total information received in 1970 that was sent by informant i , $\lambda_{ij,70}$ is the fraction of that information pertaining to sector j , and I_s is the total inflow in period s received from sources already active in 1970. In the bottom panel, the instrument is constructed as $\sum_{s=t-5}^{t-3} \sum_{i^*(s) | i^* \neq j} \bar{I}_{i^*j}$, where \bar{I}_{i^*j} is the average annual inflow of information generated by informant i^* pertaining to sector j over the entire sample period, and $i^*(s)$ denotes all informants who are last observed in period s . In both panels, the normalization/functional form of the instrument then follows the normalization/functional form of the espionage regressor. Note that the log of the predicted inflow from old informants (second panel, columns (16) to (18)) is not a feasible instrument since all its variation is absorbed by the sector and time fixed effects. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

Note: Sample based on 3-year intervals and overlapping observations for the period 1970 to 1989. The functional form of the inflow variable, which is also applied to the patents gap measure, is reported in the column heading. S_t/L_t is measured in pieces of information per 100 workers, S_t in 1,000 pieces of information and $\ln(S_t)$ in log pieces of information. All regressions include time- and sector-specific fixed effects. Observations are weighted by the average number of workers in a sector. The dependent variable is the change in the log output per worker gap between West and East Germany over the period t to $t+3$. In the second panel, the instrument is constructed as $\sum_{i \in 1970} \theta_{i,70} \lambda_{i,70} \sum_{s=t-2}^t I_s$, where $\theta_{i,70}$ is the share of the total information received in 1970 that was sent by informant i , $\lambda_{i,70}$ is the fraction of that information pertaining to sector j , and I_s is the total inflow in period s received from sources already active in 1970. In the bottom panel, the instrument is constructed as $\sum_{s=t-3}^{t-1} \sum_{i^*(s)} (\bar{I}_{i^*,j}) \geq 20$, $\bar{I}_{i^*,j}$ is the average annual inflow of information generated by informant i^* pertaining to sector j over the entire sample period, and $i^*(s)$ denotes all informants who are last observed in period s . In both panels, the normalization/functional form of the instrument then follows the normalization/functional form of the espionage regressor. Note that the log of the predicted inflow from old informants (second panel, columns (16) to (18)) is not a feasible instrument since all its variation is absorbed by the sector and time fixed effects. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

Note: Estimated specification as in column (3) of Table 2. In column (1), the technology parameters α_{ij} are sector- and country-specific. For West Germany, we use the average sector-specific capital shares over the period 1970 to 1989 reported in the EU KLEMS Growth and Productivity Accounts. For East Germany, we use the aggregate sector-specific capital shares of the ten Central and Eastern European countries that joined the EU in May 2004. In column (2), we use West German sector-specific capital shares to proxy for the the technology parameters α_{ij} in East Germany. In columns (3) to (5), we assume constant values for α_{ij} in both countries and across all sectors. In the first three panels, depreciation rates are assumed to be constant in both countries and across all sectors. In the bottom panel, we allow the depreciation rate to differ between West and East Germany. For West Germany, we use the average annual depreciation rate of the capital stock reported in the Penn World Table 9.0 for the period 1970 to 1989 (4.2%). For East Germany, we use the unweighted average of all depreciation rates that pertain to Central and Eastern European countries, averaged over the period 1970 to 1989 (5.1%). Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

| Observations | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 240 | 192 | 192 | 192 | 192 | |

Note: Sample based on 3-year intervals and overlapping observations for the period 1970 to 1989. All regressions include time- and sector-specific fixed effects. Observations are weighted by the average number of workers in a sector. The dependent variable is the change in the log gross value added gap between West and East Germany over the period t to t+3. The instrumental variables are described in Section V A. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap procedure using 999 replications.

TABLE A16: FURTHER ALTERNATIVE OUTCOMES

| | GDR Exports | Patenting |
|---------------------------------------|-------------------|-------------------|
| | (1) | (2) |
| <u>OLS</u> | | |
| Espionage | 0.064 (0.029) | -0.144 (0.056) |
| GDR Patents/Y | yes | yes |
| Log TFP Gap | yes | yes |
| P-value WB | 0.176 | 0.047 |
| R-squared | 0.04 | 0.98 |
| Observations | 772 | 240 |
| <u>IV - Old Informants</u> | | |
| Espionage | 0.212 (0.161) | -0.236 (0.027) |
| GDR Patents/Y | yes | yes |
| Log TFP Gap | yes | yes |
| P-value WB | 0.480 | 0.002 |
| F-stat | 8.1 | 73.5 |
| Observations | 772 | 240 |
| <u>IV - Exit of Informants</u> | | |
| Espionage | -0.002 (0.108) | -0.620 (0.160) |
| GDR Patents/Y | yes | yes |
| Log TFP Gap | yes | yes |
| P-value WB | 0.980 | 0.182 |
| F-stat | 10.5 | 32.4 |
| Observations | 650 | 192 |

Sample based on 3-year intervals and overlapping observations for the period 1970 to 1989. All regressions control for changes in the sector-specific log capital stock and employment as in equation (6), and include time- and sector-specific fixed effects. All dependent variables are measured as changes between period t and t+3. The instrumental variables are described in Section V.A. In column (1), the dependent variable is the change in the log value of East German exports of 86 distinct products compiled from East German Statistical Yearbooks (measured in nominal Valuta Mark). In column (2), the dependent variable is the future patent intensity in East Germany. Observations are weighted by the average number of workers in a sector. Standard errors are clustered at the sectoral level and shown in parentheses. P-value WB denotes p-values, relating to the espionage estimate, from Cameron et al. (2008)'s wild cluster bootstrap-t procedure using 999 replications.

Figures

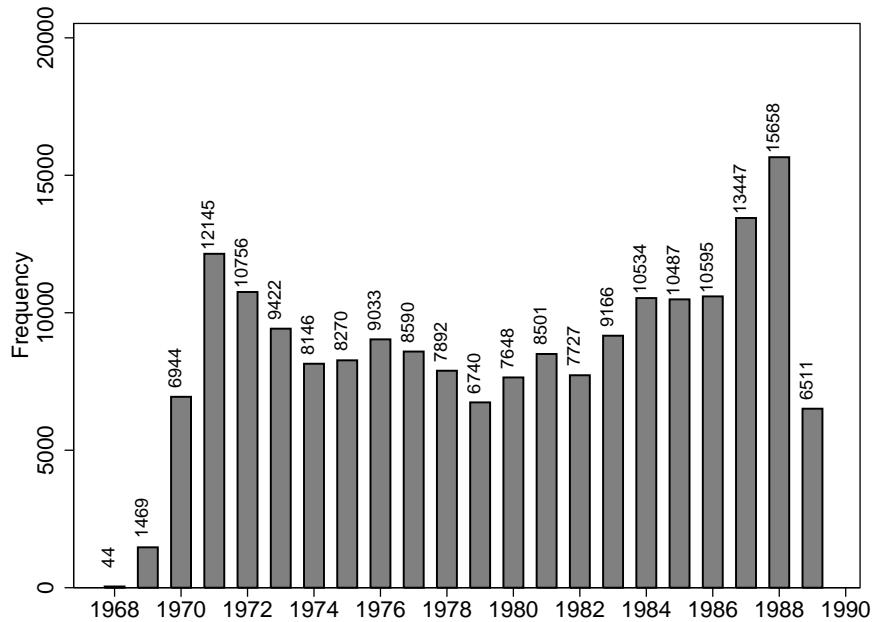

FIGURE A1: INFORMATION INFLOW, 1968-1989

Note: Figure shows the annual inflow of information received by the HVA between 1968 and 1989. Data for 1968/69 and 1989 incomplete.

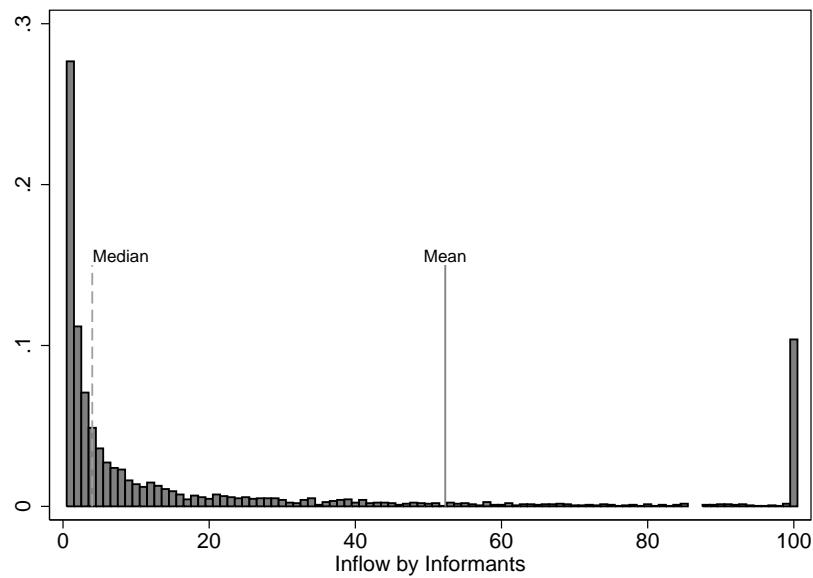

FIGURE A2: INFLOW DISTRIBUTION ACROSS INFORMANTS

Note: The figure shows the distribution of the total number of pieces of information received from individual informants. For better readability, observations are censored at a value of 100.

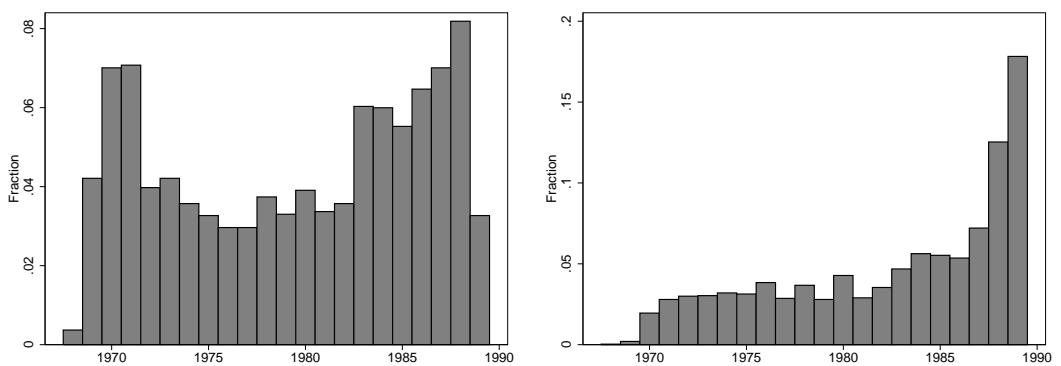

FIGURE A3: FIRST AND LAST ACTIVE YEAR

Note: The figure shows the distributions of the first (left panel) and last year (right panel) in which individual informants are observed in the data.

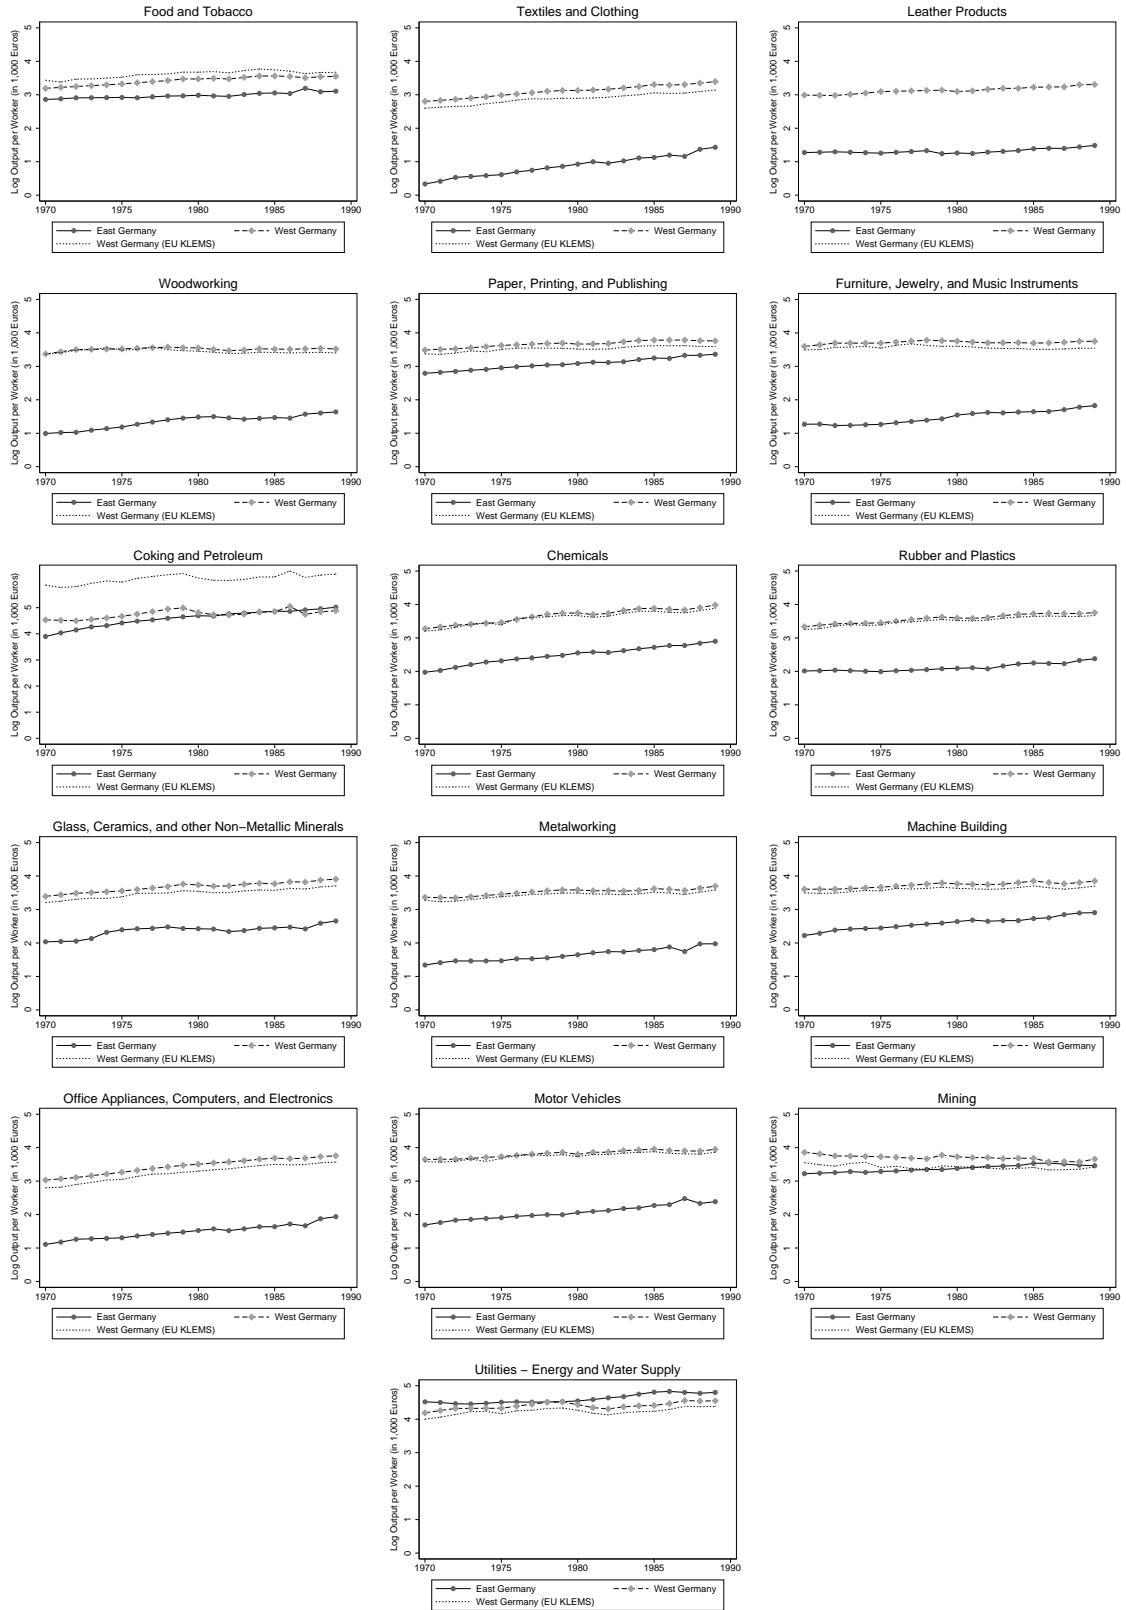

FIGURE A4: LOG OUTPUT PER WORKER BY SECTOR

Note: The individual panels depict the log of gross value added per worker by sector for West and East Germany over the period 1970 to 1989.

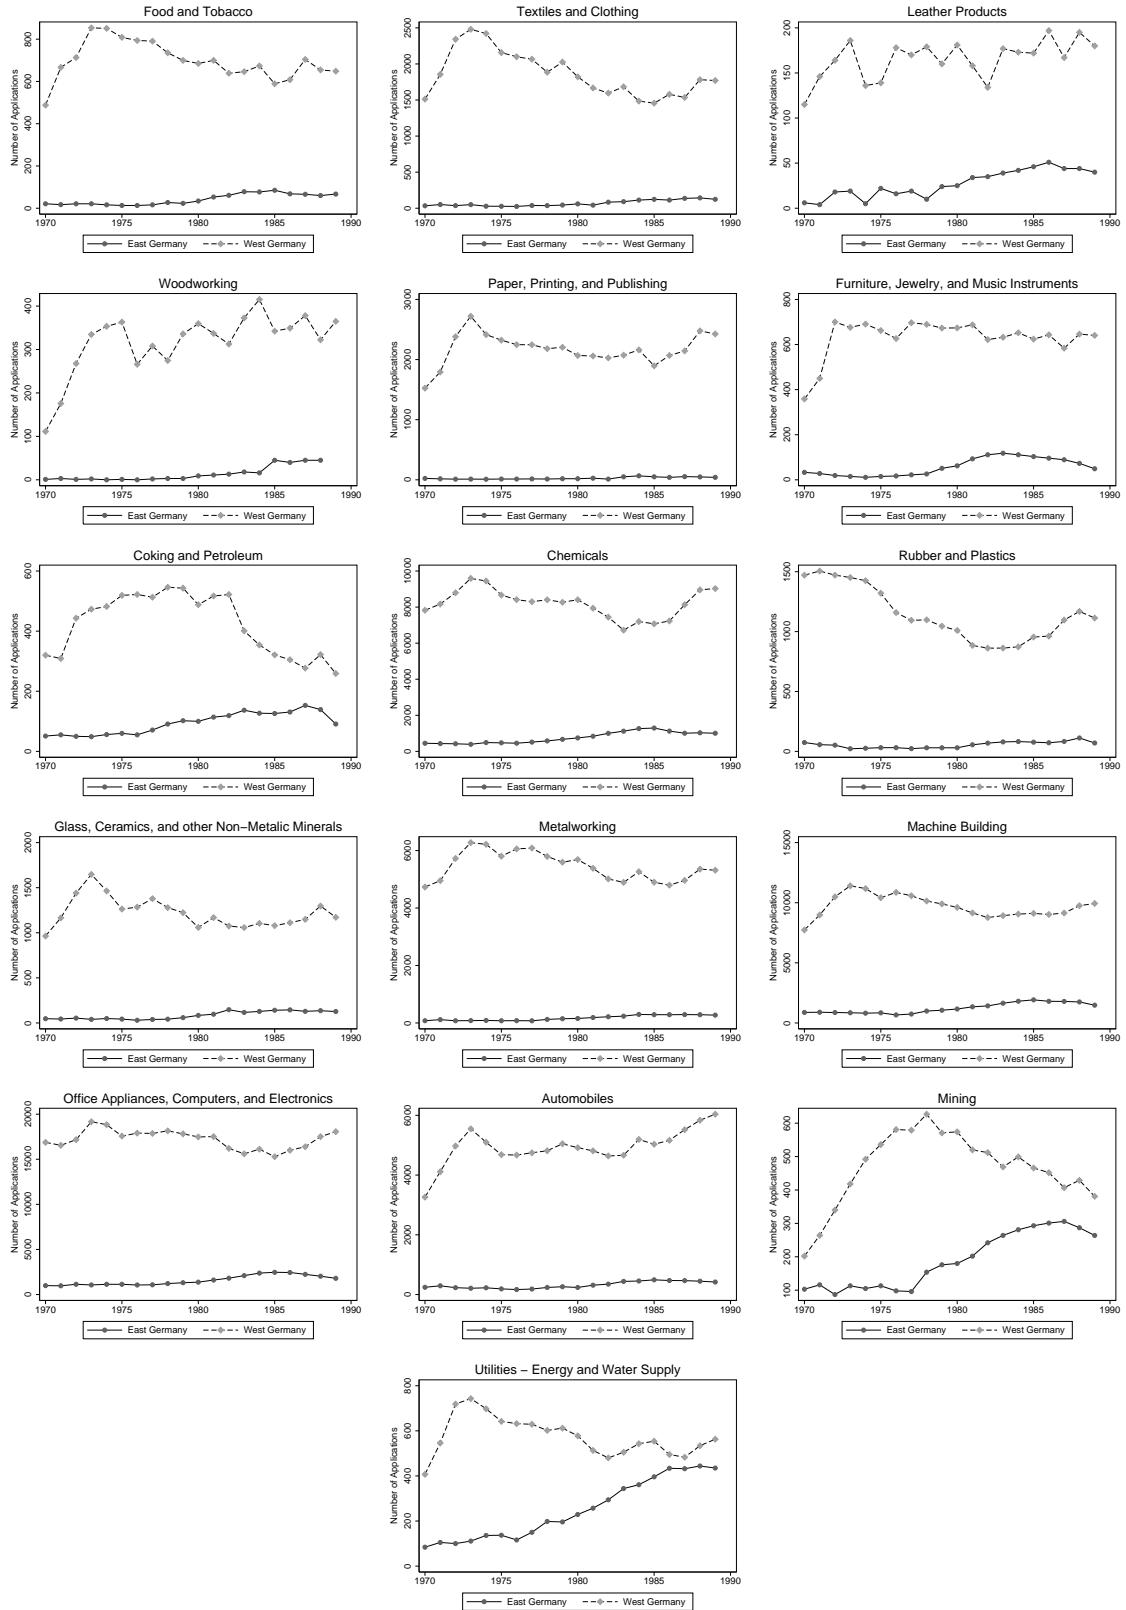

FIGURE A5: PATENT APPLICATIONS BY SECTOR

Note: The individual panels depict the number of patent applications in West and East Germany for the corresponding sectors over the period 1970 to 1989.

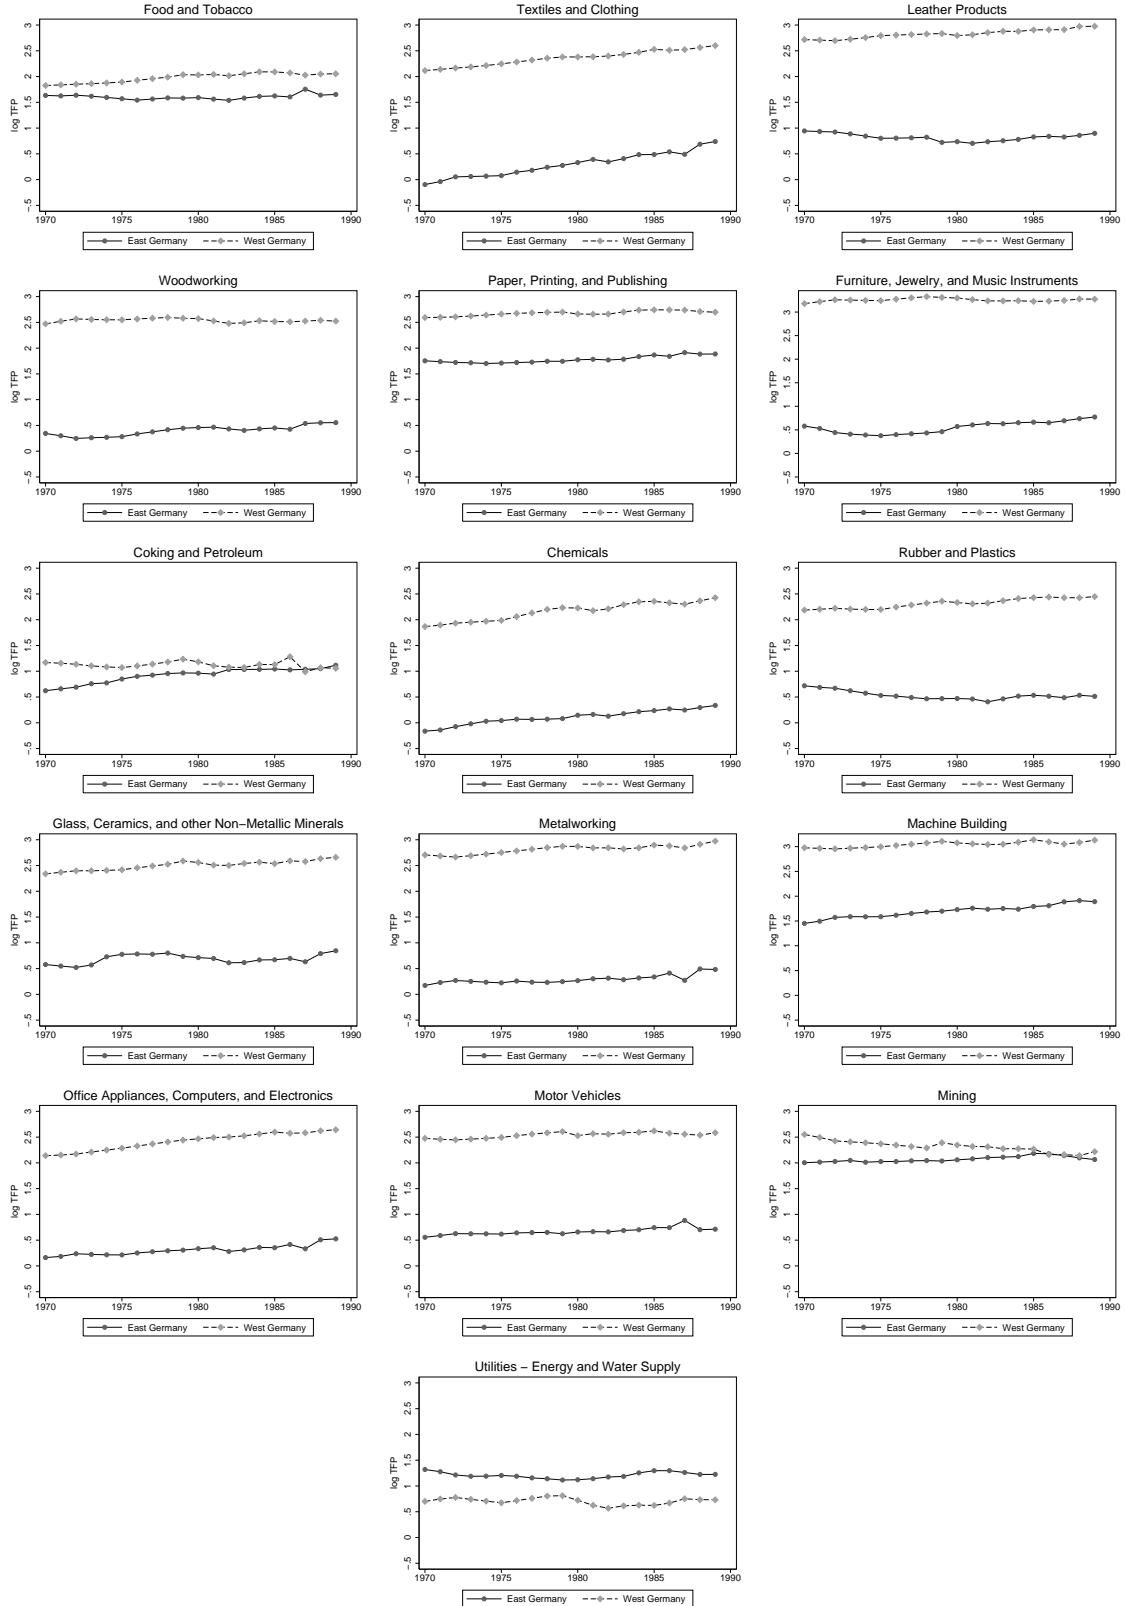

FIGURE A6: LOG TOTAL FACTOR PRODUCTIVITY BY SECTOR

Note: The individual panels depict the estimated log TFP by sector for West and East Germany over the period 1970 to 1989. TFP measures are constructed using the perpetual inventory as described in the text, assuming an annual depreciation rate of the capital stock of 6% and sector-specific capital shares taken from the EU KLEMS Growth and Productivity Accounts (November 2009 Release, updated March 2011).

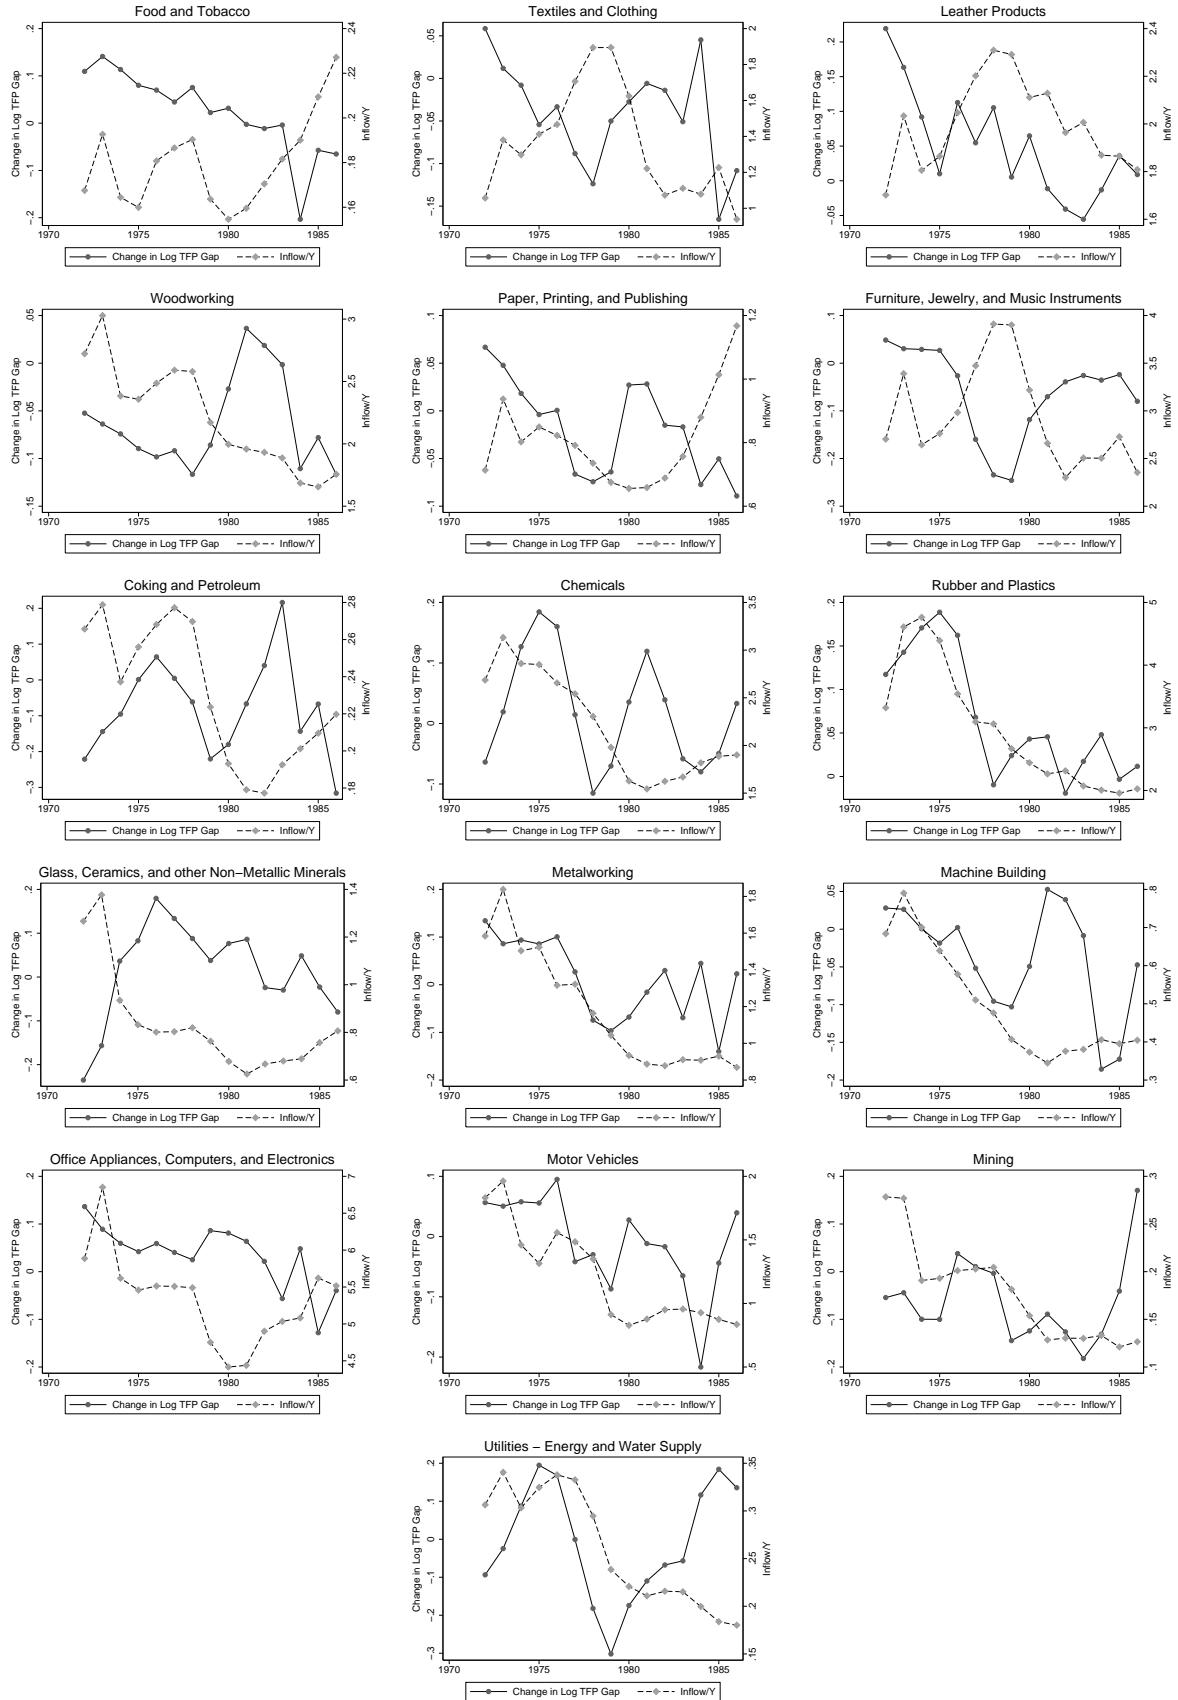

FIGURE A7: CHANGE IN LOG TFP GAP AND INFORMATION INFLOW

Note: The individual panels depict for each sector the change in the log TFP gap between West and East Germany between t and $t+3$ and the accumulated inflow of information scaled by output between $t-3$ and t .

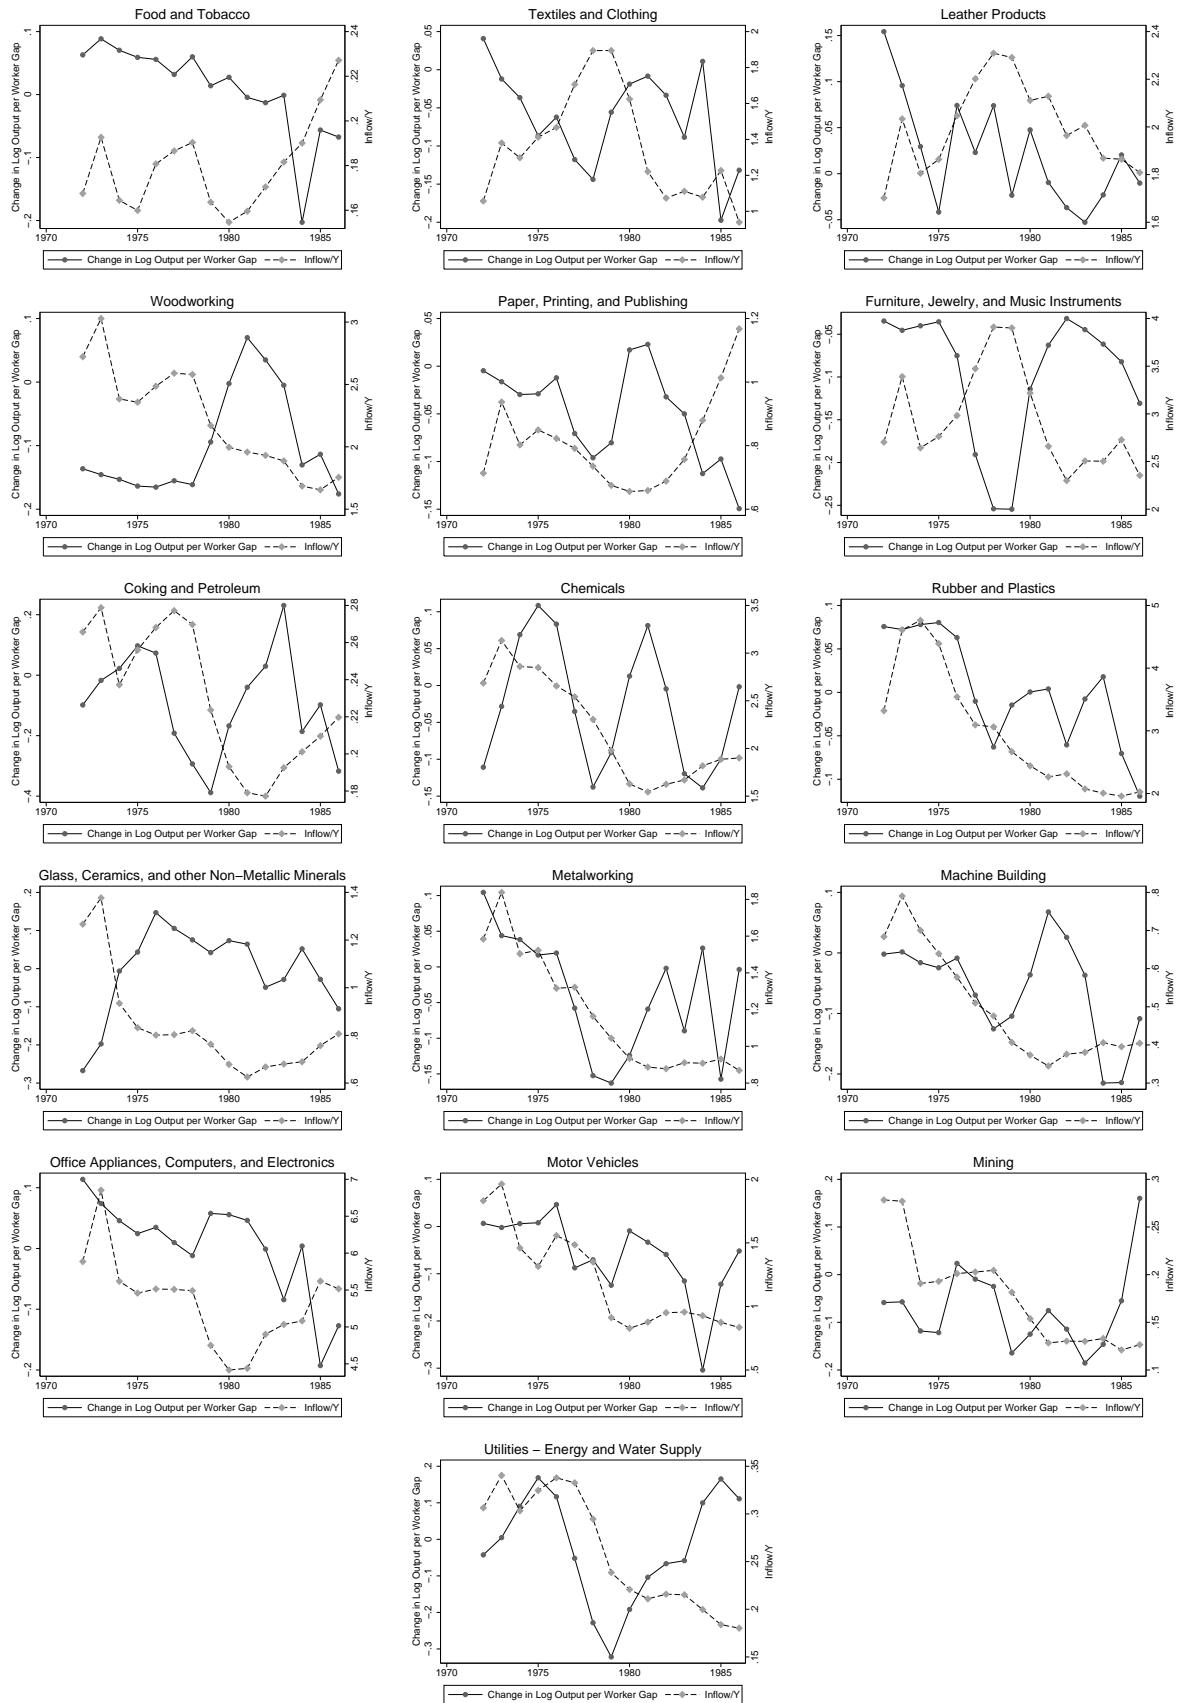

FIGURE A8: CHANGE IN LOG OUTPUT PER WORKER GAP AND INFORMATION INFLOW

Note: The individual panels depict for each sector the change in the log output per worker gap between West and East Germany between t and $t+3$ and the accumulated inflow of information scaled by output between $t-3$ and t .

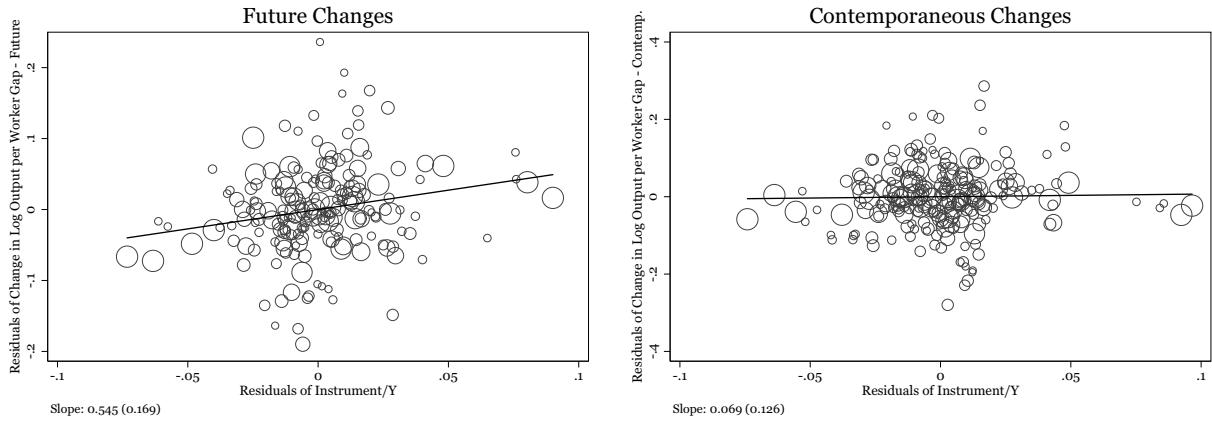

FIGURE A9: EXITS OF INFORMANTS AND CHANGES IN THE LOG OUTPUT PER WORKER GAP

Note: The figure plots residualized changes in the log output per worker gap between West and East Germany against residualized exits of highly prolific informants scaled by output. Exits are measured between the end of period $t-6$ and $t-3$. Changes in the log output per worker gap are measured between the end of period t and $t+3$ in the left panel and the end of $t-6$ and $t-3$ in the right panel. Circles are proportional to the square root of the average number of workers in an industry. The solid black lines represent the OLS regression lines.

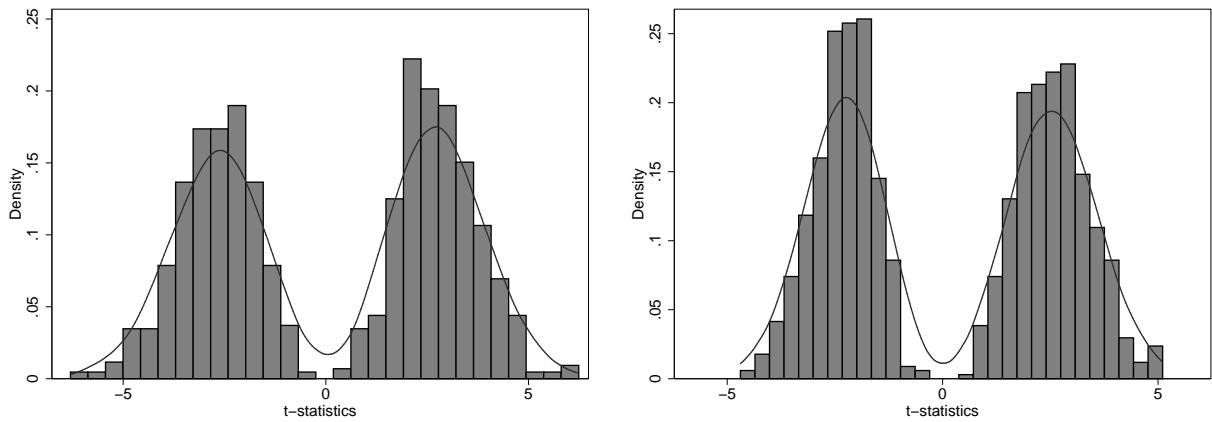

FIGURE A10: DISTRIBUTION T-STATISTICS AFTER WILD CLUSTER BOOTSTRAP

Note: The left panel depicts the distribution of the bootstrap t-statistics underlying the WB p-values reported in column (8) of the top panel in Table 5. The right panel depicts the distribution of the bootstrap t-statistics underlying the WB p-values reported in column (3) of the bottom panel in Table A10. The plotted densities are based on an Epanechnikov kernel function with default bandwidth 0.667 and 0.584 respectively.

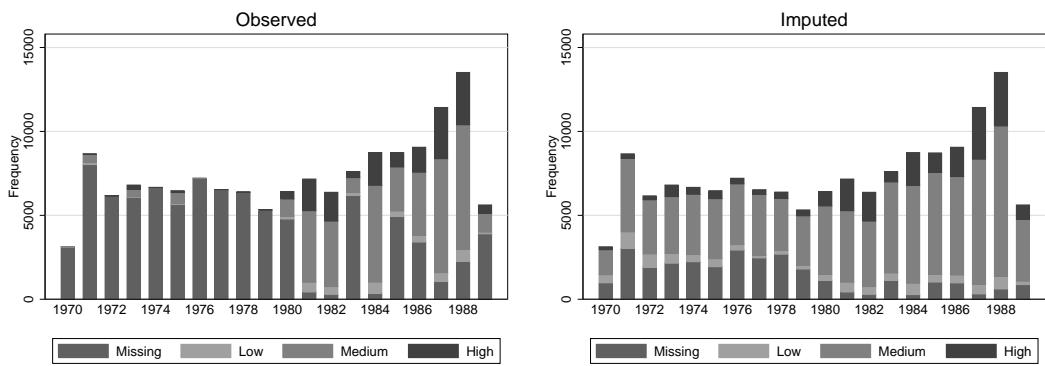

FIGURE A11: DISTRIBUTION OF QUALITY ASSESSMENTS

Note: The figure shows the distribution of quality assessments by year, both as observed in the data (left panel) and after imputing missing observations using the experienced-adjusted expected quality assessments of the informant generating the information (right panel). “Low” comprises assessments of 4 and 5, “Medium” assessments of 3, and “High” comprises assessments of 1 and 2.

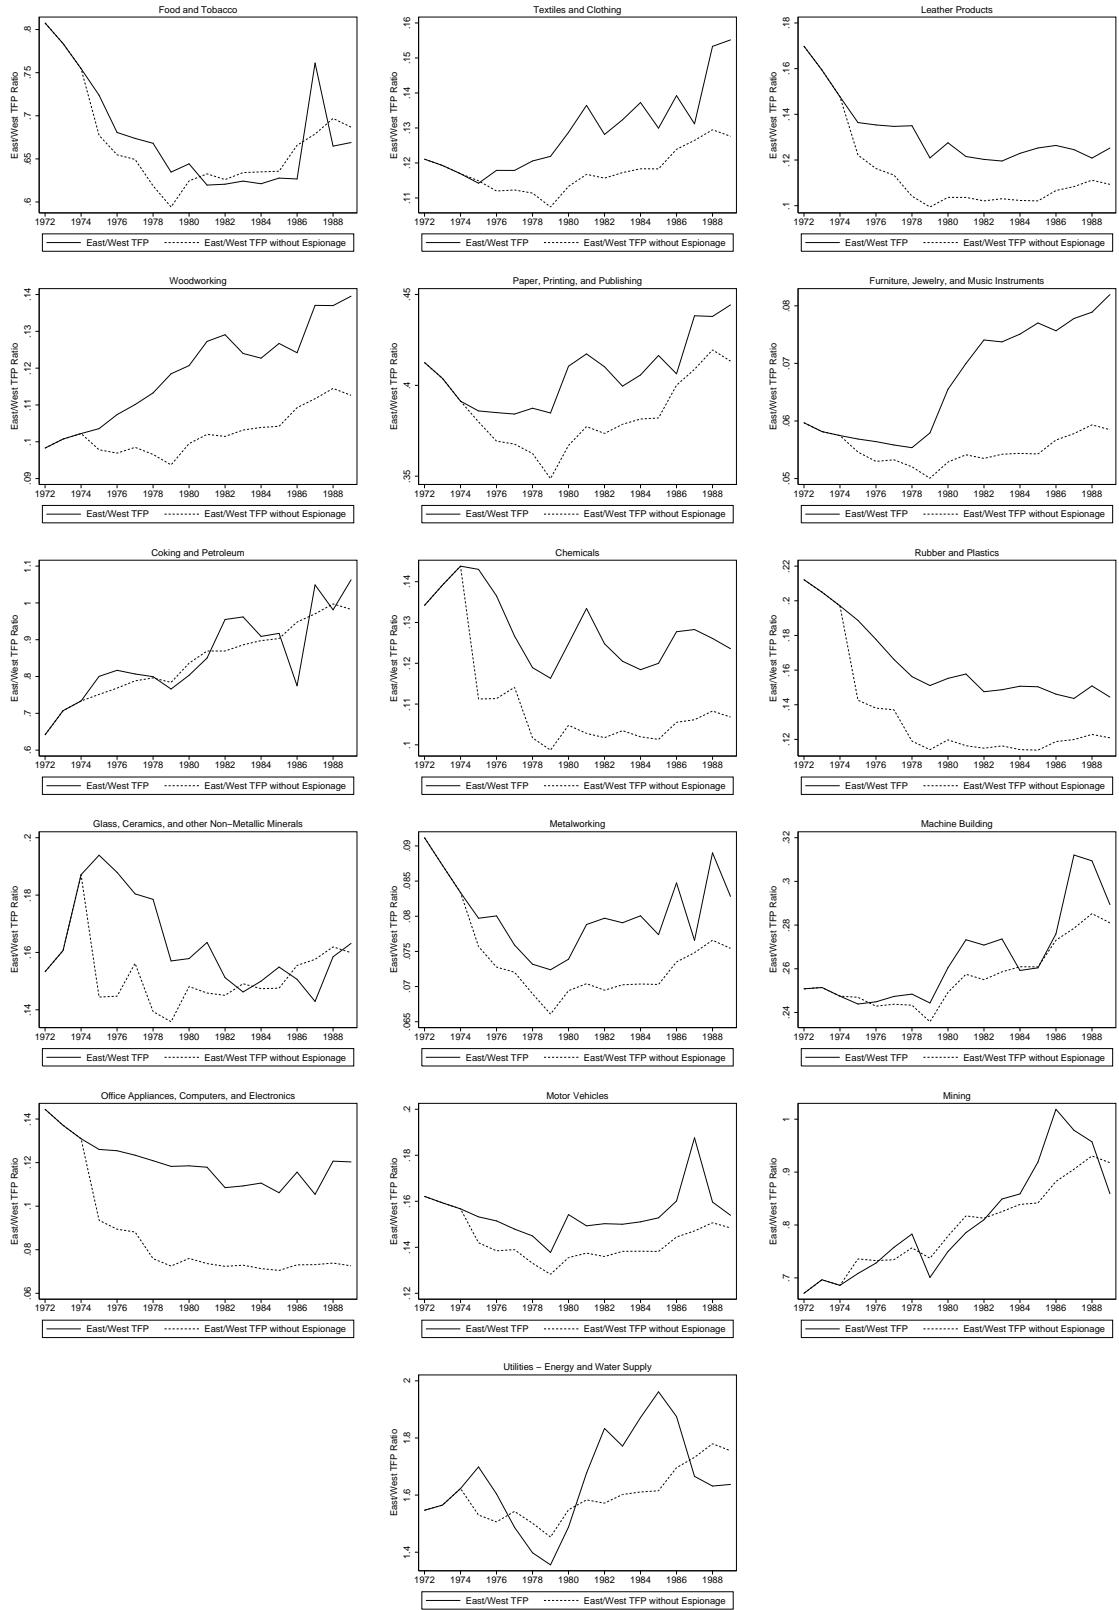

FIGURE A12: COUNTERFACTUAL SIMULATIONS BY SECTOR

Note: The individual panels depict the actual and counterfactual East/West TFP ratios in the corresponding sectors. The counterfactual simulations are based on the empirical results reported in column (3) of Table 2.
