# Online Appendix A. Figures and Tables Political Turnover, Bureaucratic Turnover and the Quality of Public Services 

Mitra Akhtari Diana Moreira Laura Trucco<br>Airbnb<br>U.C. Davis<br>Amazon

Figure A.1: McCrary Test for Manipulation of Incumbent Vote Margin

Notes: This figure shows the McCrary Test for manipulation of the running variable in the RDD, IncumbVoteMargin. The test fails to reject the null hypothesis that IncumbVoteMargin IS CONTINUOUS AT THE ZERO THRESHOLD. THE ESTIMATED DISCONTINUITY IS -. 0019 (LOG DIFFERENCE IN HEIGHT) WITH A STANDARD ERROR OF . 0607.

Figure A.2: Distribution of Incumbent Vote Margin

Notes: This histogram shows the distribution of the running variable in the RDD, IncumbVoteMargin, IN OUR SAMPLE OF MUNICIPALITIES IN THE 2008 AND 2012 ELECTION CYCLE. IncumbVoteMargin IS COMPUTED AS THE VOTE SHARE OF THE INCUMBENT POLITICAL PARTY MINUS THE VOTE SHARE OF THE INCUMBENT PARTY'S STRONGEST OPPONENT.

Figure A.3: Political Turnover and Test Scores at Baseline

NOTES: THESE GRAPHS SHOW THE (LACK OF A) DISCONTINUITY IN TEST SCORES ONE YEAR PRIOR TO THE ELECTION AS A FUNCTION OF INCUMBENT VOTE MARGIN DURING THE ELECTION FOR individual-LeVEl $4^{\text {TH }}$ (PANEL A) AND $8^{\text {TH }}$ (PANEL B) GRADE TEST SCORES. MUNICIPALITIES WITH IncumbVoteMargin<0 EXPERIENCED A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. MUNICIPALITIES WITH IncumbVoteMargin>0 DID NOT EXPERIENCE A CHANGE IN THE POLITICAL PARTY OF THE mayor. Test scores are from the Prova Brasil exam at baseline (the year before the elecTION) AND ARE STANDARDIZED BASED ON THE DISTRIBUTION OF INDIVIDUAL-LEVEL TEST SCORES IN MUNICIPALITIES WITH NO CHANGE IN THE RULINGPARTY. THE SCHOOL-LEVEL AVERAGE TEST SCORES FOR THE RESPECTIVE GRADE PRIOR TO THE BASELINE YEAR IS INCLUDED AS A CONTROL.

Figure A.4: Political Turnover and New Municipal Personnel Changes at BaseLINE

Optimal bandwidth=. 1188

Notes: This figure shows the mean of municipal-level share of new municipal personnel in 2008 AND 2012 by bins of IncumbVoteMargin. Municipalities with IncumbVoteMargin<0 EXPERIENCED CHANGE IN the political party of the mayor in 2008 or 2012 elections. Municipalities with IncumbVoteMargin>0 did not experience change in the political party of the mayor in 2008 or 2012 elections. Note that values to the right side of the zero are negative (political turnover), while values on the left side are positive (no political turnover). New Municipal Personnel (share) at baseline is the ratio between the number of new labor contracts that had been added in the 12 months before the ELECTION DIVIDED bY THE TOTAL NUMBER OF CONTRACTS THAT EXISTED ONE YEAR BEFORE THE ELECTION.

Figure A.5: External Validity Test Scores

NOTES: THIS FIGURE SHOWS COEFFICIENTS ON POLITICAL TURNOVER FROM REGRESSING 1 WITHIN DIFFERENT BANDWIDTHS OF IncumbVoteMargin (X-AXIS). OUTCOME: INDIVIDUAL-LEVEL $4^{\text {TH }}$ GRADE TEST SCORES (PANEL A) AND $8^{\text {TH }}$ GRADE TEST SCORES (PANEL B). TEST SCORES ARE FROM THE PROVA BRASIL EXAM AND ARE STANDARDIZED BASED ON THE DISTRIBUTION OF INDIVIDUAL-LEVEL TEST SCORES IN MUNICIPALITIES WITH NO CHANGE IN THE RULING PARTY. All SPECIFICATIONS CONTROL FOR SCHOOL-LEVEL, AVERAGE TEST SCORES AT BASELINE (ONE YEAR BEFORE THE RESPECTIVE ELECTION). "All MUNIC" CATEGORY INCLUDES MUNICIPALITIES WHERE PARTY DID NOT RUN FOR REELECTION AND THEREFORE IncumbVoteMargin IS NOT DEFINED (OUT OF THE BANDWIDTH SAMPLE).

Figure A.6: Political Turnover and School-level Dropout Rates

NOTES: THIS FIGURE SHOWS THE MEAN OF SCHOOL-LEVEL DROPOUT RATES BY BINS OF IncumbVoteMargin. MUNICIPALITIES WITH IncumbVoteMargin<0 EXPERIENCED A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. MUNICIPALITIES WITH IncumbVoteMargin>0 DID NOT EXPERIENCE A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. THE SCHOOL-LEVEL DROPOUT RATE IS MEASURED by the School Census and refers to the dropout rate for all students within a school (IN ALl GRADE LEVELS). THE SCHOOL-LEVEL DROPOUT RATE at baseline (THE YEAR bEFORE THE RESPECTIVE ELECTION) IS INCLUDED AS A CONTROL.

Figure A.7: Political Turnover and $4^{\text {th }}$ Grade Test Scores in Municipalities where the Winning Party was from the Left vs. the Right

Notes: This figure shows the mean of individual-Level $4^{\text {TH }}$ grade test scores by bins of IncumbVoteMargin Separately for municipalities where the winning party was from the left and those where the winning party was from the right. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. Test scores are from the Prova Brasil exam and are standardized based on the disTRIbUTION OF INDIVIDUAL-LEVEL TEST SCORES IN MUNICIPALITIES WITH NO CHANGE IN THE RULING party. Average, school-level $4^{\text {th }}$ grade test scores at baseline (the year before the respective election) is included as a control. Party ideology is classified as belonging to the left vs. the right according to Atlas Político - Mapa do Congresso.

Figure A.8: Political Turnover and $8^{\text {th }}$ Grade Test Scores in Municipalities where the Winning Party was from the Left vs. the Right

Notes: This figure shows the mean of individual-Level $8^{\text {th }}$ grade test scores by bins of IncumbVoteMargin Separately for municipalities where the winning party was from the left and those where the winning party was from the right. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. Test scores are from the Prova Brasil exam and are standardized based on the disTRIbUTION OF INDIVIDUAL-LEVEL TEST SCORES IN MUNICIPALITIES WITH NO CHANGE IN THE RULING party. Average, school-level $8^{\text {th }}$ grade test scores at baseline (the year before the reSpective election) is included as a control. Party ideology is classified as belonging to the left vs. the right according to Atlas Político - Mapa do Congresso.

Figure A.9: Political Turnover and Headmaster Replacement - Event Study

Notes: This figure shows the share of schools with a new headmaster in municipaliTIES THAT: DID NOT EXPERIENCE PARTY TURNOVER IN EITHER ELECTION CYCLE, EXPERIENCED PARTY TURNOVER ONLY IN 2008, EXPERIENCED PARTY TURNOVER ONLY IN 2012, OR EXPERIENCED PARTY TURNOVER IN BOTH ELECTION CYCLES. NEW HEADMASTERS ARE THOSE THAT REPORT BEING THE HEADMASTER OF THEIR CURRENT SCHOOL FOR LESS THAN TWO YEARS ON THE Prova Brasil HEADMASTER QUESTIONNAIRE.

Figure A.10: Political Turnover in 2008 and Headmaster Replacement 1, 3, and 5 Years After the Election

Notes: This figure shows the share of schools with a new headmaster by bins of IncumbVoteMargin 2008 Separately for each year $t$, where $t$ is one year, three years, and five years after the 2008 election. Municipalities with IncumbVoteMargin $2008<0$ experienced a CHANGE IN THE POLITICAL PARTY OF THE MAYOR. MUNICIPALITIES WITH IncumbVoteMargin $2008>0$ did not experience a change in the political party of the mayor. New headmasters are those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire.

Figure A.11: Political Turnover and Teachers who have left

Notes: This figure shows the share of teachers who have left the school by bins of IncumbVoteMargin. MUNICIPALITIES WITH IncumbVoteMargin<0 EXPERIENCED A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. MUNICIPALITIES WITH IncumbVoteMargin>0 DID NOT EXPERIENCE A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. THE SHARE OF TEACHERS WHO HAVE LEFT A SCHOOL IS COMPUTED USING THE SCHOOL CENSUS AND CORRESPONDS TO THE SHARE OF TEACHERS IN A SCHOOL WHO WERE IN THAT SCHOOL AT TIME $t-2$ (THE YEAR BEFORE THE RESPECTIVE ELECTION) BUT ARE NO LONGER IN THAT SAME SCHOOL AT TIME $t$ (ONE YEAR AFTER THE RESPECTIVE ELECTION).

Figure A.12: Political Turnover in 2008 and New Teachers 1, 3, and 5 Years After the Election

Notes: This figure shows the share of teachers that are new to a school by bins of IncumbVoteMargin ${ }_{2008}$ SEPARATELY FOR EACH YEAR $t$, WHERE $t$ IS ONE YEAR, THREE YEARS, aND FIVE years after the 2008 election. Municipalities with IncumbVoteMargin ${ }_{2008}<0$ experienced a CHANGE IN THE POLItical party of the mayor. Municipalities with IncumbVoteMargin ${ }_{2000}>0$ did not experience a change in the political party of the mayor. The share of teachers that are new to a school is computed using the School Census and corresponds to the SHARE OF TEACHERS IN A SCHOOL WHO ARE IN THAT SCHOOL AT TIME $t$ bUT WERE NOT IN THAT SAME SChool at time $t-2$.

Figure A.13: Political Turnover in 2008 and Teachers that have Left 1, 3, and 5 Years After the Election

Notes: This figure shows the share of teachers that have left a school by bins of IncumbVoteMargin ${ }_{2008}$ SEPARATELY FOR EACH YEAR $t$, WHERE $t$ IS ONE YEAR, THREE YEARS, aND five years after the 2008 election. Municipalities with IncumbVoteMargin $2008<0$ expeRienced a change in the political party of the mayor in 2008. Municipalities with IncumbVoteMargin $2_{2008}>0$ DID NOT EXPERIENCE A CHANGE IN THE POLITICAL PARTY OF THE MAYOR in 2008. The share of teachers that have left a school is computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ but are no longer in that same school at time $t$.

Figure A.14: Political Turnover and Headmaster Replacement in Low- and Highincome Municipalities

Notes: This figure shows the share of schools with a new headmaster by bins of IncumbVoteMargin Separately for municipalities with high and low income. MunicipaliTIES WITH IncumbVoteMargin<0 EXPERIENCED A CHANGE IN THE POLITICAL PARTY OF THE MAYOR. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. New headmasters are those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. Low-income municipalities are those below the median in the municipal-level distribution of median monthly household income as measured in the 2000 Census. High income municipalities are those above the median in this distribution.

Figure A.15: Political Turnover and New Teachers in Low- and High-income MuNICIPALITIES

Notes: This figure shows the share of teachers that are new to a school by bins of IncumbVoteMargin Separately for municipalities with high and low income. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. The share of teachers that are new to a school is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (ONE year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). Low-income municipalities are those below the median in the municipal-level distribution of median monthly household income as measured in the 2000 Census. High income municipalities are those AbOVE THE MEDIAN IN THIS DISTRIBUTION.

Figure A.16: Political Turnover and Teachers that have left in Low- and Highincome Municipalities

Notes: This figure shows the share of teachers that have left a school by bins of IncumbVoteMargin SEPARATELY FOR mUNiCipalities with high and low income. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. The share of teachers that have left a school is computed using the School Census and corresponds to the share of teachers in a school who were in that SCHOOL at time $t-2$ (THE Year before the respective election) but are no longer in that SAME SCHOOL at time $t$ (ONe year after the respective election). Low-income municipalities are those below the median in the municipal-level distribution of median monthly household income as measured in the 2000 Census. High income municipalities are those AbOVE THE MEDIAN IN THIS DISTRIBUTION.

Figure A.17: Political Turnover and Headmaster Replacement in Municipalities where the Winning Party was from the Left vs. the Right

Notes: This figure shows the share of schools with a new headmaster by bins of IncumbVoteMargin SEPARATELY FOR MUNICIPALITIES WHERE THE WINNING PARTY WAS FROM THE left and those where the winning party was from the right. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. New headmasters are those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. Party ideology is classified as belonging to the left vs. the right according to Atlas Político Mapa do Congresso.

Figure A.18: Political Turnover and New Teachers in Municipalities where the Winning Party was from the Left vs. the Right

Notes: This figure shows the share of teachers that are new to a school by bins of IncumbVoteMargin Separately for municipalities where the winning party was from the left and those where the winning party was from the right. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. The share of teachers that are new to a school is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (ONe year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). Party ideology is classified as belonging to the left vs. the right according to Atlas Político - Mapa do Congresso.

Figure A.19: Political Turnover and Teachers that have Left in Municipalities where the Winning Party was from the Left vs. the Right

Notes: This figure shows the share of teachers that have left a school by bins of IncumbVoteMargin Separately for municipalities where the winning party was from the left and those where the winning party was from the right. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. The share of teachers that have left a school is computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (ONe year after the respective election). Party ideology is classified as belonging to the left vs. the right according to Atlas Político - Mapa do Congresso.

Figure A.20: Political Turnover and Teachers that have Left in Non-municipal Schools

Notes: This figure shows the share of teachers that have left non-municipal schools by bins of IncumbVoteMargin. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. The share of teachers that have left a School is computed using the School Census and corresponds to the share of teachers IN A SCHOOL WHO WERE IN THAT SCHOOL AT TIME $t-2$ (THE YEAR bEFORE THE RESPECTIVE ELECTION) but are no longer in that same school at time $t$ (ONe year after the respective election). The set of non-municipal schools for this outcome is comprised of state, federal, and private schools.

Figure A.21: Political Turnover and $8^{\text {th }}$ Grade Test Scores in Non-municipal Schools

Notes: This figure shows the mean of individual-level $8^{\text {th }}$ grade test scores for students in non-municipal schools by bins of IncumbVoteMargin. Municipalities with IncumbVoteMargin<0 experienced a Change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-Level test scores in municipalities with no change in the ruling party. Average, school-level $8^{\text {th }}$ Grade test scores at baseline (the year before the respective election) is included as a control. The set of non-municipal schools for this outcome is comprised of state and federal schools, since only public schools participate in the Prova Brasil exam.

Figure A.22: Political Turnover and $4^{\text {th }}$ Grade Test Scores in Low- and HighQUALITY Schools

Notes: This figure shows the mean of individual-level $4^{\text {Th }}$ grade test scores by bins of IncumbVoteMargin SEPARATELY FOR LOW- AND HIGH-QUALITY municipal SChools. Municipalities with IncumbVoteMargin<0 experienced a change in the political party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-Level test scores in municipalities with no change in the ruling party. Average, school-level $4^{\text {th }}$ grade test scores at baseline (the year before the respective election) is included as a control. Low-quality schools are those below the median in the school-level distribution of test scores at baseline (the year before the respective election). High-quality schools are those above the median in this disTRIBUTION.

Figure A.23: Political Turnover and $8^{\text {th }}$ Grade Test Scores in Low- and HighQUALITY Schools

Notes: This figure shows the mean of individual-level $8^{\text {th }}$ Grade test scores by bins of IncumbVoteMargin SEPARATELY FOR LOW- AND HIGH-QUALITY municipal SChools. Municipalities WITH IncumbVoteMargin<0 EXPERIENCED a CHANGE IN THE POLItical Party of the mayor. Municipalities with IncumbVoteMargin>0 did not experience a change in the political party of the mayor. Test scores are from the Prova Brasil exam and are standardized based on THE DISTRIBUTION OF INDIVIDUAL-LEVEL TEST SCORES IN MUNICIPALITIES WITH NO CHANGE IN THE ruling party. Average, school-level $8^{\text {th }}$ grade test scores at baseline (the year before the respective election) is included as a control. Low-quality schools are those below the median in the school-level distribution of test scores at baseline (the year before the respective election). High-quality schools are those above the median in this disTRIBUTION.

Figure A.24: School Personnel Characteristics 2007-2011
(a) Teacher with B.A.

(b) Headmasters with Graduate Training

(c) Headmasters Experience (as Headmaster)

NOTES: THIS FIGURE SHOWS SCHOOL PERSONNEL CHARACTERISTICS IN MUNICIPALITIES THAT EXPERIENCED POLITICAL TURNOVER IN 2008 AND MUNICIPALITIES THAT DID NOT EXPERIENCE. SAMPLE RESTRICTED TO MUNICIPALITIES WITH CLOSE ELECTIONS $\left(\mid I_{m}\right.$ cumbVoteMargin $\left.2008 \mid<\mathbf{0 . 0 9}\right)$. DASHED VERTICAL LINE REPRESENTS END OF MAYOR'S TERM. THE SHARE OF TEACHERS WITH B.A. (P\&JEL A) IS FROM THE SCHOOL CENSUS, AVERAGED AT THE MUNiCIPAL-LEVEL. HEADMASTER CHARACTERISTICS ARE SHARE OF HEADMASTERS WITH GRADUATE TRAINING (Panel B) and number of years of experience as Headmaster (Panel C), extracted from the Prova BRASIL HEADMASTER QUESTIONNAIRE AND AVERAGED AT THE MUNICIPAL-LEVEL.

Figure A.25: Municipal Personnel Characteristics 2007-2011

NOTES: THIS FIGURE SHOWS SCHOOL PERSONNEL CHARACTERISTICS IN MUNICIPALITIES THAT EXPERIENCED POLITICAL TURNOVER IN 2008 AND MUNICIPALITIES THAT DID NOT EXPERIENCE. SAMPLE RESTRICTED TO MUNICIPALITIES WITH CLOSE ELECTIONS $\left(\mid\right.$ ImcumbVoteMargin $\left._{2008} \mid<\mathbf{0 . 0 9}\right)$. DASHED VERTICAL LINE REPRESENTS END OF MAYOR'S TERM. THE MUNICIPAL PERSONNEL CHARACTERISTICS ARE FROM RAIS. THE VARIABLES AGE AND SENIORITY WERE CALCULATED AS THE AVERAGE ATTRIBUTE AMONG WORKERS EMPLOYED IN THE MUNICIPALITY ONE YEAR AFTER THE ELECTION.

Table A.1: Political Turnover and $4^{\text {TH }}$ Grade Test Scores for All MuniciPALITIES

|  | Outcome: Individual $4^{\text {th }}$ Grade Test Scores (standardized) |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ | $(6)$ |
| Party Turnover | -0.065 | -0.066 | -0.070 | -0.066 | -0.070 | -0.070 |
|  | $(0.031)$ | $(0.029)$ | $(0.036)$ | $(0.033)$ | $(0.031)$ | $(0.028)$ |
| School-level baseline scores | 0.841 | 0.713 | 0.827 | 0.701 | 0.838 | 0.711 |
|  | $(0.018)$ | $(0.019)$ | $(0.024)$ | $(0.026)$ | $(0.017)$ | $(0.018)$ |
| N |  |  |  |  |  |  |
| R-squared | 582,788 | 582,788 | 405,856 | 405,856 | 601,125 | 601,125 |
| Controls | 0.199 | 0.235 | 0.189 | 0.225 | 0.197 | 0.233 |
| Clusters | No | Yes | No | Yes | No | Yes |
| Using Bandwidth | 2153 | 2153 | 1606 | 1606 | 2193 | 2193 |
| Optimal Bandwidth | 0.107 | 0.107 | 0.0700 | 0.0700 | 0.110 | 0.110 |
| lins | 0.107 | 0.107 | 0.107 | 0.107 | 0.107 | 0.107 |

This table includes the sample of all municipalities, including those with irregular elections and those that could potentially go to a second round of elections (population $\geq 200,000$ ). The endogenous variable, Party Turnover, is instrumented for using the incumbent political party's vote margin from the first round of regular elections. The first-stage coefficients for the instrument range from .80-.81 across bandwidths (not reported). All specifications control for school-level, average test scores for $4^{\text {th }}$ graders at baseline (one year before the respective election). Controls include school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet), individual-level controls (an indicator variable for gender, whether the student is white, and whether the student sees their mother reading), and a 2012 election-cycle indicator.

Table A.2: Political Turnover and $8^{\text {th }}$ Grade Test Scores for All MuniciPALITIES

|  | Outcome: Individual $8^{\text {th }}$ |  |  |  |  |  |  | Grade Test Scores (standardized) |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ | $(6)$ |  |  |
| Party Turnover | -0.080 | -0.068 | -0.086 | -0.087 | -0.086 | -0.084 |  |  |
|  | $(0.029)$ | $(0.030)$ | $(0.038)$ | $(0.038)$ | $(0.034)$ | $(0.034)$ |  |  |

| Optimal Bandwidth | 0.128 | 0.128 | 0.0700 | 0.0700 | 0.110 | 0.110 |

This table reports the coefficient on candidate turnover from regressing individual-level $4^{\text {th }}$ grade test scores (Panel A) and $8^{\text {th }}$ grade test scores (Panel B) on the running variable of the RDD (IncumbCandidateVoteMargin), candidate turnover ( $\mathbb{1}\{$ IncumbCandidateVoteMargin $<0\}$ ), and the interaction of these two variables for the set of municipalities with $\mid$ IncumbCandidateVoteMargin $\mid<$ Using Bandwidth. Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-level test scores in municipalities with no change in the ruling party. All specifications control for school-level, average test scores for the respective grader at baseline (one year before the respective election). Controls include school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet), individual-level controls (an indicator variable for gender, whether the student is white, and whether the student sees their mother reading), and a 2012 election-cycle indicator.

Table A.4: $4^{\text {TH }}$ Grade Test Scores by Municipalities' Characteristics

This table reports the coefficient on Political turnover from regressing the individual 4th grade test score estimating Equation 2. Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-level test scores in municipalities with no change in the ruling party. All specifications control for school-level, average test scores for 4th graders at baseline (one year before the 2008 election). Above Median Population is an indicator variable equal to 1 if municipality's population is above median of population distribution at baseline (one year before the election). Above Median N. schools is an indicator variable equal to 1 if municipality's count of schools is above median of school count distribution according to School Census at baseline (one year before the election). Left Ideology Wins is an indicator variable equal to 1 if a left-wing party won the election and 0 if a right-wing party won. Party ideology is classified as belonging to the left vs. the right according to Atlas Politico - Mapa do Congresso.

Table A.5: Selection of Municipalities and Schools into the Sample

| N (municipality-election cycle) |  | 106 |  | 66 |  | 08 |

This table shows descriptive statistics for: all municipalities, municipalities in our sample, and municipalities in our sample with at least one school that participates in the Prova Brasil exam. Our sample is selected by dropping: municipalities with irregular elections, municipalities that could potentially go to second-round elections, and municipalities where the incumbent political party did not run for re-election. Furthermore, schools that participate in the Prova Brasil exam are schools with at least 20 students enrolled in the relevant grade-level. Hence the sample of schools for which we have Prova Brasil data for is also "selected." The unit of observations is a municipality-election cycle.

| Controls and FE | No | Yes |
| Clusters | 4988 | 4988 |
| Mean LHS | -0.0948 | -0.0948 |

This table reports the coefficient on unconditional party and candidate turnover estimating OLS regressions. Outcome: the individual-level $4^{\text {th }}$ grade test scores. Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-level test scores in municipalities with no change in the ruling party. Controls include school-level, average test scores for 4th graders at baseline (one year before the 2008 election), school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet), individual-level controls (an indicator variable for gender, whether the student is white, and whether the student sees their mother reading), a 2012 election-cycle indicator and municipal fixed effects. Unconditional party turnover equals one if the incoming party is different than incumbent party and zero otherwise. It is well defined even if the incumbent party did not participate in the election. Unconditional candidate turnover is equal to one if newly elected candidate is different than incumbent candidate and zero otherwise. Likewise the variable is well defined even if the candidate chose not to participate in the election.

This table reports the coefficient on political party turnover estimating Equation 1. Outcome variables: in columns 1-3, Panel A, New municipal personnel (share) is the ratio between the number of new labor contracts that had been added on a annual basis up to 1 month before the election divided by the total number of contracts that existed 12 month prior to the election, in Columns 4-6, Panel A, Municipal Personnel Who Left (share) is analogous and uses number of terminated contracts; in Columns 7-9, Panel A Net Municipal Personnel (Share) is the difference between New municipal personnel (share) and Municipal Personnel Who Left (share). Panel B uses the corresponding outcome variables where new and terminated contracts were measured 12 months before the election.

This table reports the coefficient on political party turnover estimating Equation 1. Outcome variables: New municipal personnel (share) is the ratio between the number of new labor contracts that had been added every quarter after the election divided by the total number of contracts that existed the month prior to the election (Panel A). Column 1 (Oct-Dec) uses contracts added on the quarter following the election, on the same year and under same mayor term. Column 2-4 use contracts added on each one of the first three quarters over the year after the election in chronological order and are thus under a new term for the elected mayor. Municipal Personnel Who Left (share) is analogous and uses number of terminated contracts (Panel B).

This table reports the coefficient on political party turnover estimating Equation 1. Outcome variables: New Municipal Personnel by contract type ( as $\%$ of total personnel in that contract type) is the ratio between the number of new labor contracts (of a given type) that had been added 12 months after the election divided by the total number of contracts (of a given type) in the month prior to the election; in Panel B, Municipal Personnel Who have Left by contract type ( as \% of total personnel in that contract type) is analogous and uses number of terminated contracts. Attributes come from RAIS and are type of contract, hierarchical level and sector employed.

This table reports the coefficient on political party turnover from regressing each of the student characteristic variables on the running variable of the RDD (IncumbVoteMargin), political party turnover ( $\mathbb{1}\{$ IncumbVoteMargin $<0\}$ ), and the interaction of these two variables for the set of municipalities with $\mid$ IncumbVoteMargin $\mid<U s i n g$ Bandwidth. The Asset Index is constructed as follows. We standardize the responses to a series of questions - regarding the number of household items (colored TV, radio, fridge, bathroom), whether or not the student has other items (a VCR/DVD player, a freezer, a vacuum cleaner, a computer, Internet), and how often a domestic worker comes to the student's house - by subtracting the overall mean and dividing by the standard deviation of all student responses for each question. We then add all these standardized question responses to arrive at the "Asset Index." The Parental Involvement Index is constructed as follows. We standardize responses to a series of questions - regarding how often the students' parents attend Parent-Teacher Council meetings, whether parents talk to the student about what happens in school, and whether parents incentivize the student to do homework, read, and attend school - by subtracting the overall mean and dividing by the standard deviation of all student responses for each question. We then add all these standardized question responses to arrive at the "Parental Involvement Index." Student characteristics are from the Prova Brasil questionnaire filled out by students. Controls include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet) and a 2012 election-cycle indicator.

Table A.14: Political Turnover and Number of Students Enrolled

This table reports the coefficient on political party turnover estimating Equation 1. The outcomes are the individual-level $4^{t h}$ grade test scores (columns 1 and 2), an indicator variable for whether the school has a new headmaster (columns 3 and 4), share of teachers that are new to the school (columns 5 and 6) and share of teachers that have left a school (columns 7 and 8). Test scores are from the Prova Brasil exam and are standardized based on the distribution of individual-level test scores in municipalities with no change in the ruling party. Headmaster Turnover is an indicator variable for whether the school has a new headmaster, those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. The share of teachers that are new to a school is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (one year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). The share of teachers that have left a school is also computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (one year after the respective election). Controls include a 2012 election-cycle indicator and school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet). In Columns 1 and 2 only, there are also for school-level, average test scores for 4 th graders at baseline (one year before the 2008 election) and, in Column 2, individual-level controls (an indicator variable for gender, whether the student is white, and whether the student sees their mother reading). The analysis is made separately for schools that had a politically appointed headmaster at baseline (Panel A) and those that did not (Panel B). Politically appointed headmasters are those who report being some type of "appointee" on the Prova Brasil headmaster questionnaire.

This table shows the same analysis as in Table 4 separately for low-income (Panel A) and high-income (Panel B) municipalities. Low-income municipalities are those below the median in the municipal-level distribution of median monthly household income as measured in the 2000 Census. High income municipalities are those above the median in this distribution.

This table reports the coefficient on political party turnover estimating Equation 2. Outcomes: Headmaster Replacement (Column 1) is an indicator variable for whether the school has a new headmaster, those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. The share of teachers that are new to a school (Column 2) is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (one year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). The share of teachers that have left a school (Column 3) is also computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (one year after the respective election). New municipal personnel (share) is the ratio between the number of new labor contracts that had been added 12 months after the election divided by the total number of contracts that existed the month prior to the election (Column 4) and Municipal Personnel Who Left (share) is analogous and uses number of terminated contracts (Column 5). Left Ideology Wins is an indicator variable equal to 1 if a left-wing party won the election and 0 if a right-wing party won. Party ideology is classified as belonging to the left vs. the right according to Atlas Politico - Mapa do Congresso.
Table A.26: Political Turnover and Teacher Replacements by Winning Party Ideology

| Outcome | Share of Teachers New to the School |  |  |  |  |  | Share of Teachers that have Left the School |  |  |  |  |  |

This table reports the coefficient on political party turnover estimating Equation 2. Outcomes: The share of teachers that are new to a school (Columns 1-6) is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (one year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). The share of teachers that have left a school (Columns 7-12) is also computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (one year after the respective election). Controls include a 2012 election-cycle indicator and school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet). Left Ideology Wins is an indicator variable equal to 1 if a left-wing party won the election and 0 if a right-wing party won. Party ideology is classified as belonging to the left vs. the right according to Atlas Político - Mapa do Congresso.

This table shows the same analysis as in Table 3 (Panel A) separately for low-income (Panel A) and highincome (Panel B) municipalities. Low-income municipalities are those below the median in the municipallevel distribution of median monthly household income as measured in the 2000 Census. High income municipalities are those above the median in this distribution.

This table shows the same analysis as in Table 3 (Panel B) separately for low-quality (Panel A) and highquality (Panel B) municipal schools. Low-quality schools are those below the median in the school-level distribution of test scores at baseline (the year before the respective election). High-quality schools are those above the median in this distribution.

This table reports the coefficient on political party turnover estimating Equation 1. Outcomes: Headmaster characteristics (Panel A) are from the Prova Brasil headmaster questionnaire. The teacher characteristics (Panel B) are from the School Census and are averaged at the school-level. Controls include a 2012 electioncycle indicator and school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet). The set of non-municipal schools in Panel A is comprised of state and federal schools, since only public schools participate in the Prova Brasil exam. The set of non-municipal schools in Panel B is comprised of state, federal, and private schools (since all schools participate in School Census).

This table reports the coefficient on political party turnover from regressing each of the headmaster characteristic variables on the running variable of the RDD (IncumbVoteMargin), political party turnover $(\mathbb{1}\{$ IncumbVoteMargin $<0\})$, and the interaction of these two variables for the set of municipalities with $\mid$ IncumbVoteMargin $\mid<U s i n g$ Bandwidth. Headmaster characteristics are from the Prova Brasil headmaster questionnaire. Controls include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet) and a 2012 election-cycle indicator.

Table A.32: Political Turnover and Teacher Characteristics
$\left.\begin{array}{lccccccc}\hline \text { Outcome: } & \begin{array}{c}\mathrm{N} \\ \text { Teachers }\end{array} & \text { Age } & \text { Female } & \text { B.A. } & \begin{array}{c}\text { Graduate } \\ \text { Training } \\ (1)\end{array} & (2) & (3)\end{array} \begin{array}{c}\text { Temporary } \\ \text { Contract } \\ (4)\end{array} \begin{array}{c}\text { Contract } \\ \text { Type Missing } \\ (7)\end{array}\right]$

This table reports the coefficient on political party turnover from regressing each of the teacher characteristic variables on the running variable of the RDD (IncumbVoteMargin), political party turnover $(\mathbb{1}\{$ IncumbVoteMargin $<0\})$, and the interaction of these two variables for the set of municipalities with $\mid$ IncumbVoteMargin $\mid<$ Using Bandwidth. The teacher characteristics are from the School Census and are averaged at the school-level. Controls include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet) and a 2012 election-cycle indicator.

This table reports the coefficient on Political turnover from regressing municipal personnel characteristics estimating Equation 1. The municipal personnel characteristics are from RAIS. The variables Age, Mean Wage and Seniority were calculated as the average attribute among workers employed in the municipality one year after the election. The variables College, High School and Middle School are each the share of the workers with the respective attribute among the employed in the municipality one year after the election.

This table reports the coefficient on political party turnover in 2008 estimating Equation 2. Outomces: The survey responses are from the Prova Brasil headmaster questionnaire. Teacher Council Meetings refers to the number of teacher council meetings that have been held in the school this year (ranges from 0-3). Coordinated Curriculum refers to whether the school has a teaching plan (Projeto Pedagogico). Curriculum Together refers to whether the headmasters and teachers developed the teaching plan together. Textbooks On-time refers to whether the school received its textbooks at the beginning of the school-year and Textbooks Correct refers to whether the appropriate textbooks were (eventually) received. Each of the Program variables refers to whether the school offers that particular program for students. Teacher Training Held refers to whether the school held any teacher training sessions. Finally, Teacher Training Participation refers to the share of teachers who participated in the teacher training sessions (conditional on the school holding at least one such session). Problems Index (Column 11) is constructed with headmaster's survey responses in a way that a higher index corresponds to fewer problems. Controls include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet). 2011 is an indicator for outcomes in 2011 Prova Brasil edition.

Table A.36: Political Turnover and School Problems (as Reported by the Teacher)

| Outcome: | Teacher Council <br> Meetings <br> $(1)$ | Coordinated <br> Curriculum <br> $(2)$ | Curriculum <br> Together <br> $(3)$ | Relationship w/ <br> Headmaster (Index) | Relationship w/ <br> Teachers (Index) <br> $(5)$ | Collaborative <br> Environment |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $(6)$ |  |  |  |  |  |

This table reports the coefficient on political party turnover from regressing each of the outcome variables (survey responses) on the running variable of the RDD (IncumbVoteMargin), political party turnover ( $\mathbb{1}\{$ IncumbVoteMargin $<0\}$ ), and the interaction of these two variables for the
 is administered to teachers who proctor the exam. Teacher Council Meetings refers to the number of teacher council meetings that have been held in the school this year (ranges from 0-3). Coordinated Curriculum refers to whether the school has a teaching plan (Projeto Pedagogico). Curriculum Together refers to whether the headmasters and teachers developed the teaching plan together. The Relationship with Headmaster Index is constructed as follows. We standardize the responses to a series of questions - regarding whether the teacher trusts the headmaster, whether the teacher believes the headmaster motivates her, is committed to the school, innovates, cares about the students, cares about the school personnel, and cares about the school as a whole, and whether the teacher respects the headmaster/feels respected by the headmaster - by subtracting the overall mean and dividing by the standard deviation of all teacher responses for each question. We then add all these standardized responses to arrive at the "Relationship w/ Headmaster Index." The Relationship with Teacher Index is constructed as follows. We standardize the responses to a series of questions - regarding whether the teachers share ideas and whether the teachers work together - by subtracting the overall mean and dividing by the standard deviation of all teacher responses for each question. We then add all these standardized responses to arrive at the "Relationship w/ Teacher Index." Finally, Collaborative Environment refers to how collaborative the teacher feels the school is (on a scale of 1-5, where 5 is very collaborative). Controls include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet) and a 2012 election-cycle indicator.

This table reports the coefficient on Political turnover from regressing teacher characteristics estimating Equation 2. The teacher characteristics are from the School Census and are averaged at the school-level. Politically appointed headmasters are those who report being some type of "appointee" on the Prova Brasil headmaster questionnaire.

# Table A.39: Political Turnover and School Problems (Reported by Headmaster AND TEACHER) 

This table reports the coefficient on political party turnover estimating Equation 1 and controlling by the various types of personnel replacements. Outcome: School Problems Index: Reported by Headmasters and Teacher. Index is constructed with survey responses from the Prova Brasil questionnaire, which is administered to headmasters and teachers who proctor the exam, and in a way that a higher index corresponds to fewer problems. New Headmaster are those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. The share of teachers that are new to a school is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (one year after the respective election) but were not in that same school at time $t-2$ (the year before the respective election). The share of teachers that have left a school is also computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (one year after the respective election). The shares are split by which grade the teacher was assigned to, also according to School Census. "Except 4th Grade" category includes teachers assigned to other grades and to no specific grade, besides not assigned to teaching. New municipal personnel (share) is the ratio between the number of new labor contracts that had been added 12 months after the election divided by the total number of contracts that existed the month prior to the election and Municipal Personnel Who Left (share) is analogous and uses number of terminated contracts. Controls include a 2012 election-cycle indicator and school-level controls (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet).

This table reports the coefficient on political party turnover estimating Equation 1. The share of teacher that are new to the school (Panel A) is computed using the School Census and corresponds to the share of teachers in a school who are in that school at time $t$ (one year after the respective election) but were not in that same school at time $t-2$ (the year before the election). The share of teachers that have left a school (Panel B) is also computed using the School Census and corresponds to the share of teachers in a school who were in that school at time $t-2$ (the year before the respective election) but are no longer in that same school at time $t$ (one year after the respective election). In both panels, All (Column 1 ) includes 1st to 8th grades, Multi-Grade teachers and the Residual category and replicates our baseline results for teacher replacements. Column 2 represents teachers in Elementary School Grades and Column 3 those in Middle School. Columns 4-7 show every Elementary School grade separately. Multigrade (Column 8) includes teachers assigned to a multi-grade classroom for Elementary or Middle School. Residual (Column 9) includes teachers that are not assigned to teaching or whose grade has not been specified.

Table A.41: Headmaster and Teacher Replacement by Skill Type

This table reports the coefficient on political party turnover estimating Equation 2. Outcomes: Headmaster Replacement (Columns 1-3) is an indicator variable for whether the school has a new headmaster, those that report being the headmaster of their current school for less than two years on the Prova Brasil headmaster questionnaire. Individual Teacher Left (Columns 4-6) is an indicator variable equal to one if the teacher was in a school at time $t-2$ (the year before the respective election) but are no longer in that school at time $t$ (one year after the respective election) and is computed using the School Census. Headmaster's quality index refer to the headmaster characteristic at $t-2$ and the components are age, having college, having graduate training, salary, years of experience as a headmaster and in education, according to Prova Brasil headmaster questionnaire. Teacher's quality index refer to the teacher characteristic at $t-2$ and the components are age, having college and having graduate training, as reported on School Census.

This table reports the coefficient on political party turnover from regressing each of the variables on the running variable of the RDD (IncumbVoteMargin), political party turnover ( $\mathbb{1}\{$ IncumbVoteMargin $<0\}$ ), and the interaction of these two variables for the set of municipalities with $\mid$ IncumbVoteMargin $\mid<$ Using Bandwidth. It shows municipal-level regressions, using data from the Brazilian Federal Treasury for both election cycles 2008 and 2012 in Panels A-C. Panel A refers to different categories of municipal financial resources assessed one year after the election, Panel B refers to resources assessed two years after the election and Panel C refers to resources assessed three years after the election. Expenditures on Education (share) is the share of the municipality's total budget spent on education and Expenditures on Personnel (share) is the share of the municipality's total budget spent on personnel and labor related expenses across all sectors in the municipality - not only education. Panel D shows school-level regressions, using data from the Prova Brasil headmaster questionnaire (for both election-cycles). Controls in Panel D include school-level controls taken from the School Census (whether: the school is located in an urban or rural area, the school is connected to the electric grid, the school is connected to the water network, the school is connected to the sewage system, the school's trash is regularly collected, and the school has Internet) and a 2012 electioncycle indicator.

# Online Appendix B. Conceptual Framework <br> Political Turnover, Bureaucratic Turnover and the Quality of Public Services 

By Mitra Akhtari, Diana Moreira \& Laura Trucco

Figure B.1. : Model Timeline

A period represents a politician's term. Every period the politician in office, a challenger or an incumbent, decides to retain or replace bureaucrats. By the end of the politician's term, a bureaucrat with ability $a_{i}$ and loyalty $j$ produces a public good $\left(a_{i}\right)$ and a political service $\left(s_{j}\right)$. Figure ?? summarizes the timing. For each bureaucrat who is not retained, the politician can choose the loyalty of the newly-hired replacement but cannot choose his ability. Any newly-hired bureaucrat in period $t=0$ will have ability $a_{i} \in\left\{a_{1}, a_{2}, a_{3}\right\}$ randomly drawn from a distribution with mean $E[a]$, where $a_{1}<E[a]<a_{2}<a_{3}$, and the ability is revealed only after hiring (in period $t=0.5$ ).

A bureaucrat can be either loyal to the challenger or the incumbent. $\mathrm{j} \in$ [incumbent, challenger] defines whether bureaucrat is aligned to the Incumbent's party or the challenger's party. When politicians and bureaucrats are aligned we call the bureaucrat a loyalist. A loyalist bureaucrat produces a higher political service than a non-loyalist (i.e., $s_{\text {loyalist }}>s_{\text {non-loyalist }}$ ). Considering the challenger is taking office, the political service output the bureaucrat produces is:
$s_{j}=\left\{\begin{array}{cc}S & \text { if } \mathrm{j}=\text { challenger } \\ 0 & \text { if } \mathrm{j}=\text { incumbent }\end{array}\right\}$
where $S>0$
We assume that the expected total output produced by a newly hired loyalist is higher than the total output produced by a mid-ability non-loyalist (Assumption 1), but the opposite holds for the high-ability bureaucrat (i.e., Assumption 2: $\left.s_{\text {non-loyalist }}+a_{3}>s_{\text {loyalist }}+E[a]\right)$ :

Assumption 1: $\quad S+E[a]>0+a_{2}$
Assumption 2: $\quad 0+a_{3}>S+E[a]$

Bureaucrats can become entrenched with probability $(\pi)$. To simplify the model, only $a_{2}$ can become entrenched. Entrenchment leads to higher production of the political service output for the loyal politician ( $S^{\text {entr }}>S$ ) and also decreases his ability-productivity $\left(a_{2}^{\text {entr }}<a_{2}\right)$. The entrenchment is captured by a parameter $\delta>0$ :

Bureaucrats in office can become entrenched with probability $\pi$. We assume for simplicity that only $a_{2}$ type can get entrenched. Relative to a non-entrenched bureaucrat, an entrenched bureaucrat produces lower public good output ( $a_{2}^{\text {entr }}<$ $a_{2}$ ), and produces a larger political service output only when he is a loyalist $\left(s_{\text {loyalist }}^{\text {entr }}>s_{\text {loyalist }}\right)$.
$s^{\text {entr }}=S+\delta>S \quad$ and $\quad a_{2}^{\text {entr }}=a_{2}-\delta<a_{2}$
hence we have $s_{j}^{\text {entr }}=\left\{\begin{array}{cc}S^{\text {entr }} & \text { if } j=\text { challenger } \\ 0 & \text { if } j=\text { incumbent }\end{array}\right\}$
We assume that an entrenched bureaucrat produces lower public good than the expected public good from a newly-hired bureaucrat:

$$
\text { Assumption 3: } \quad a_{2}-\delta<E[a]
$$

Politicians \& Society The politician values both outputs, while society only values the public good. Let $\gamma_{t}\left(a_{i}, j\right)$ be the share of bureaucrats in period $t$ with attributes $\left(a_{i}, j\right)$. Given a distribution of bureaucrats in $t=0$, the politician chooses to retain or replace them to maximize bureaucrats' total output in pe$\operatorname{riod} t=1$ :

Society's welfare:

$$
\sum_{i=1,2,3} \sum_{j=\text { incumbent }}^{\text {challenger }} a_{i} \times \gamma_{1}\left(a_{i} ; j\right)+\sum_{j=\text { incumbent }}^{\text {challenger }}-\delta \times \gamma_{1}\left(a_{2} ; j\right) \times \pi
$$

Politician's Objective function:

$$
\sum_{\substack{i=1,2,3}}^{\sum_{j=\text { incumbent }}^{\text {challenger }}\left(s_{j}+a_{i}\right) \times \gamma_{1}\left(a_{i} ; j\right)+\sum_{j=\text { incumbent }}^{\text {challenger }}\left[\left(s_{j}^{\text {entr }}+a_{2}^{\text {entr }}\right)-\left(s_{j}+a_{2}\right)\right] \times}
$$

To match our empirical setting, we investigate the case where there was an
incumbent in charge in period $t=-1$, and we contrast the decision of a challenger in charge in period $t=0$ against the decision that would have occurred if the incumbent party had continued in office.

Proposition 1: Upon arrival a challenger (that follows an incumbent administration) will face the following distribution of bureaucrat in the bureaucracy at $\mathrm{t}=0$ :

$$
\begin{aligned}
& \gamma_{0}\left(a_{1} ; \text { challenger }\right)=0 \\
& \gamma_{0}\left(a_{2} ; \text { challenger }\right)=0 \\
& \gamma_{0}\left(a_{2}^{e n t r} ; \text { challenger }\right)=0 \\
& \gamma_{0}\left(a_{3} ; \text { challenger }\right)>0 \\
& \gamma_{0}\left(a_{1} ; \text { incumbent }\right)>0 \\
& \gamma_{0}\left(a_{2} ; \text { incumbent }\right)>0 \\
& \gamma_{0}\left(a_{2}^{\text {entr }} ; \text { incumbent }\right)>0 \\
& \gamma_{0}\left(a_{3} ; \text { incumbent }\right)>0
\end{aligned}
$$

In words: the former administration (incumbent party) has replaced all lowlevel ability bureaucrats and has retained all high-level ability bureaucrats, both regardless of loyalty status. The former administration has also replaced mid-level ability non-loyalists, while retaining mid-level ability loyalists. Note that despite that all the low-ability bureaucrats were fired at $t=-1$, at $t=0$ there are still some low-ability bureaucrats (i.e., $\gamma_{0}\left(a_{1} ;\right.$ incumbent $\left.)>0\right)$ due to the bad draw in the process of hiring new loyalists.

Proposition 2: A challenger replaces an additional share of bureaucrats relative to the continued incumbent, precisely $\gamma_{0}\left(a_{2} ;\right.$ incumbent $)+\gamma_{0}\left(a_{2}^{\text {entr }} ;\right.$ incumbent $)$.

A challenger makes the following decision regarding bureaucrats' allocation (considering the types with positive mass at time 0 according to proposition 1 ):

- Replace ( $a_{1}, a_{2}, a_{2}^{\text {entr }}$; incumbent). This is due to assumption 1 since the expected total output of a newly-hired loyalist (i.e., loyalist to the challenger) will be higher: $S+E[a]>a_{2}+0>a_{2}^{\text {entr }}+0>a_{1}+0$. Hence a total of: $\gamma_{0}\left(a_{1} ;\right.$ incumbent $)+\gamma_{0}\left(a_{2} ;\right.$ incumbent $)+\gamma_{0}\left(a_{2}^{\text {entr }} ;\right.$ challenger $)$ will be replaced.
- Retain ( $a_{3}$; incumbent) and ( $a_{3}$; challenger). This is due to assumption 2 since the expected total output of a newly-hired loyalist will be lower: $S+a_{3}>a_{3}+0>S+E[a]$

If, however, it is a continuing incumbent party, the continuing incumbent will:

- Replace ( $a_{1}$; incumbent). This is because the expected output of a newlyhired loyalist is higher than the total output of lowest ability loyalist $S+$ $E[a]>S+a_{1}$.
- Retain ( $a_{3}, a_{2}, a_{2}^{\text {entr }}$; incumbent) and ( $a_{3}$; challenger). This is because the total output of a mid-ability loyalist (or a high-ability non-loyalist) is higher
than the expected output of a newly-hired loyalist: $a_{2}+S>E[a]+S$ and $a_{3}+S>a_{3}+0>E[a]+S$. Since from the perspective of the incumbent, total output of a mid-ability bureaucrat is the same regardless of entrenchment, the inequality also holds for entrenched bureaucrats: $a_{2}^{\text {entr }}+S^{\text {entr }}=a_{2}+S>$ $E[a]+S$

Proposition 3 A challenger replaces an additional share of bureaucrats (i.e., "politically motivated replacements") relative to the continued incumbent. Public good output might be smaller or larger depending on $\pi$ :
if $\pi=1$ (i.e. all $a_{2}$ gets entrenched) $\rightarrow$ bureaucrats' public goods output is larger under the challenger administration. Since $a_{2}-\delta<E[a]$ due to assumption 3.
if $\pi=0$ (i.e. no $a_{2}$ gets entrenched) $\rightarrow$ bureaucrats' public goods output is smaller under challenger administration. Since $a_{2}>E[a]$ due to assumption 1 .
$0<\pi<1$ can lead to either a larger or smaller output, it will depend on the parameter values.

No Entrechment ( $\pi$ ). We discuss in greater detail the case of $\pi=0$ as it better matches our empirical finding that political turnover leads to adverse consequences for public education.

Note that the average ability of employed bureaucrats may also increase when the challenger chooses to replace low-ability bureaucrats. However, this same set of low-ability bureaucrats would also have been replaced by the continuing incumbent, thereby increasing the average ability level in their bureaucracy.

## $E_{t=-1}[a \mid$ incumbent admin. at $\mathrm{t}=-1]<E_{t=0}[a \mid$ incumbent admin. at $\mathrm{t}=0]$

However, the challenger also replaces an additional number of bureaucrats. This decision leads to a lower ability of employed bureaucrats (relative to what one would observe if a continuing incumbent had continued):

$$
\begin{equation*}
E_{t=0}[a \mid \text { challenger admin. at } \mathrm{t}=0] \ll E_{t=0}[a \mid \text { incumbent admin. at } \mathrm{t}=0] \tag{E1}
\end{equation*}
$$

And, under certain parameter values, also leads to a decrease in average quality over time

$$
\begin{equation*}
E_{t=0}[a \mid \text { challenger ruling at } \mathrm{t}=0]<E_{t=-1}[a \mid \text { incumbent ruling at } \mathrm{t}=-1] \tag{E2}
\end{equation*}
$$

The required condition for statement (E2) to hold is the following:

$$
\underbrace{\left(E[a]-a_{1}\right) \times \gamma_{0}\left(a_{1}, \text { incumbent }\right)}_{\text {benefit of firing low-level ability }}<\underbrace{\left(a_{2}-E[a]\right) \times \gamma_{0}\left(a_{2}, \text { incumbent }\right)}_{\text {cost of firing mid-level ability }}
$$

Therefore, even in the absence of entrenchment the model does not predict public good output would decrease overtime. The consequence for society's welfare of a challenger taking office (relative to welfare in time $t-1$ ) is given by:

$$
\underbrace{\left(E[a]-a_{1}\right)}_{>0} \times \gamma_{0}\left(a_{1}, \text { incumbent }\right)+\underbrace{\left(E[a]-a_{2}\right)}_{<0} \times \gamma_{0}\left(a_{2}, \text { incumbent }\right)
$$

While, society's welfare of a challenger taking office (relative to the case when the incumbent continues in office)

$$
\Delta \text { Society's Welfare: }\left(E[a]-a_{2}\right) \times \gamma_{0}\left(a_{2}, \text { incumbent }\right)<0
$$

Hence, when there is no entrenchment $(\pi=0)$ political transitions leads to lower public good output.

## Implications and Predictions

This simple model generates predictions that we can test in our empirical setting. The model predicts that when a challenger takes office (relative to the case when incumbent continues):

Prediction 1. A challenger replaces an additional share of bureaucrats relative to the continued incumbent. Public good output might be smaller or larger depending on entrenchment $(\pi)$. A challenger will fire an additional $\gamma_{0}\left(a_{2} ;\right.$ incumbent $)+$ $\gamma_{0}\left(a_{2}^{\text {entr }}\right.$; incumbent $)$ fraction of bureaucrats. As a result total bureaucrats' output might be smaller or larger depending on the extent of entrenchment $(\pi)$.
Prediction 2. Assuming no entrenchment (i.e., $\pi=0$ ), bureaucrats' output under the challenger will be lower than under the continued incumbent. This difference can be attributed to the lower average quality of bureaucrats that results from replacements.
Prediction 3. Assuming no entrenchment (i.e., $\pi=0$ ), in choosing to replace a bureaucrat, the challenger trades off a bureaucrat who produces a larger public good output and little political services against another bureaucrat who produces a smaller expected public good output but also produces a higher political service. Replacement patterns should reflect this trade-off.

## Proofs

Prediction 1. (this is demonstrated by Proposition 1) A bureaucrat will be replaced if he produces a total output smaller than the expected total output of a newly hired bureaucrat:

$$
s_{j}+a_{i}<S+E(a)
$$

So, following Assumptions 1 and $3\left(S+E[a]>a_{2}>E[a]\right.$ and $\left.a_{2}-\delta<E[a]\right)$, bureaucrats of types $a_{2}$ and $a_{2}^{e n t r}$ aligned with the incumbent will be fired only by the challenger:

$$
\begin{aligned}
a_{2}: \quad \text { Incumbent's payoff } & >S+E[a]>\text { Challenger's payoff } \\
S+a_{2}-\pi \delta & >S+E[a]>a_{2}-\pi \delta \\
a_{2}^{\text {entr }}: \quad \text { Incumbent's payoff } & >S+E[a]>\text { Challenger's payoff } \\
(S+\delta)+\left(a_{2}-\delta\right) & >S+E[a]>a_{2}-\delta \\
S+a_{2} & >S+E[a]>a_{2}-\delta
\end{aligned}
$$

For types $a_{1}$ and $a_{3}$ the decision to fire or not is the same for incumbents or challengers, no matter the alignment of the bureaucrat:

$$
\begin{array}{ll}
a_{1}: & S+E[a]>S+a_{1}>a_{1} \longrightarrow \text { always fired } \\
a_{3}: & S+a_{3}>a_{3}>S+E[a] \longrightarrow \text { never fired }
\end{array}
$$

The challenger replaces a share of bureaucrats (i.e., $\gamma_{0}\left(a_{1} ;\right.$ incumbent $)+\gamma_{0}\left(a_{2} ;\right.$ incumbent $)+$ $\gamma_{0}\left(a_{2}^{\text {entr }} ;\right.$ incumbent $)$ ), while the incumbent replaces only $\gamma_{0}\left(a_{1} ;\right.$ incumbent $)$ share of bureaucrats.

As fired bureaucrats will be replaced by a loyal bureaucrat with expected ability $E[a]$, this excess firing will lead to a difference in bureaucratic output of:

$$
\gamma_{0}\left(a_{2} ; \text { incumbent }\right)\left(E[a]-\left(a_{2}-\pi \delta\right)\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { incumbent }\right)\left(E[a]-\left(a_{2}-\delta\right)\right)
$$

This difference can be positive or negative depending on the extent of entrenchment $(\pi)$. Below we abbreviate "incumbent" as "inc.".

$$
\begin{aligned}
& \gamma_{0}\left(a_{2} ; \text { inc. }\right)\left(E[a]-\left(a_{2}-\pi \delta\right)\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)\left(E[a]-\left(a_{2}-\delta\right)\right)>0 \\
& \left(\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)\right)\left(E[a]-a_{2}\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right) \times \delta+\gamma_{0}\left(a_{2} ; \text { inc. }\right) \times \pi \delta>0 \\
& \gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right) \times \delta+\gamma_{0}\left(a_{2} ; \text { inc. }\right) \times \pi \delta>\left(\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)\right)\left(a_{2}-E[a]\right) \\
& \frac{\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)}{\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)} \times \delta+\frac{\gamma_{0}\left(a_{2} ; \text { inc. }\right)}{\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)} \times \pi \delta>a_{2}-E[a] \\
& \frac{\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)}{\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)}+\frac{\gamma_{0}\left(a_{2} ; \text { inc. }\right)}{\gamma_{0}\left(a_{2} ; \text { inc. }\right)+\gamma_{0}\left(a_{2}^{\text {entr }} ; \text { inc. }\right)} \times \pi>\frac{a_{2}-E[a]}{\delta} \\
& \pi+(1-\pi) \times \pi>\frac{a_{2}-E[a]}{\delta} \\
& -\pi^{2}+2 \pi>\frac{a_{2}-E[a]}{\delta}
\end{aligned}
$$

Since $\frac{a_{2}-E[a]}{\delta}<1$ due to assumptions 2 and 1 . Then, there will be $\pi^{*} \in(0,1)$ where:
If $\pi>\pi^{*},-\pi^{2}+2 \pi>\frac{a_{2}-E[a]}{\delta} \rightarrow$ Public good output will be larger under the challenger
If $0<\pi<\pi^{*},-\pi^{2}+2 \pi<\frac{a_{2}-E[a]}{\delta} \rightarrow$ Public good output will be smaller under the challenger
Prediction 2. Following the proof on prediction one, if there is no entrenchment ( $\pi=0$ ), bureaucratic output will be smaller if the challenger takes office. The difference in bureaucrat's output when a challenger takes office (relative to an incumbent) will be:

$$
\gamma_{0}\left(a_{2} ; \text { incumbent }\right)\left(E[a]-a_{2}\right)
$$

As $a_{2}>E[a]$ from Assumption 1, this will be negative and bureaucratic output will be lower if a challenger takes office.
The average ability of the employed bureaucrats will also decrease. As $a_{1}$ bureaucrats will always be fired and $a_{3}$ are always retained, the changes in average abilities will be:

Incumbent takes office: $\quad \gamma_{0}\left(a_{1} ;\right.$ incumbent $)\left(E[a]-a_{1}\right)$
Challenger takes office: $\quad \gamma_{0}\left(a_{1} ;\right.$ incumbent $)\left(E[a]-a_{1}\right)+\gamma_{0}\left(a_{2} ;\right.$ incumbent $)\left(E[a]-\left(a_{2}+\pi \delta\right)\right.$

So the difference in average ability will also be $\gamma_{0}\left(a_{2} ;\right.$ incumbent $)\left(E[a]-\left(a_{2}+\pi \delta\right)\right)$ and will decrease when a challenger takes office compared when the incumbent does so.

Prediction 3. We discuss empirically two examples consistent with the politi-
cian trading off.
Example 1: The excess replacement rate that occurs when a challenger takes office is lower for the highest ability bureaucrat relative to the excess replacement among those of lower ability.

```
\(P\left(\right.\) Replaced \(\mid a_{3}\), Challenger admin. \()-P\left(\right.\) Replaced \(\mid a_{3}\), Incumbent admin. \()\)
    \(<\)
    \(P\left(\right.\) Replaced \(\mid a_{1}\) or \(a_{2}\), Challenger admin. \()\) -
        \(P\left(\right.\) Replaced \(\mid a_{1}\) or \(a_{2}\),Incumbent admin.)
```

To see this we compare the likelihood that bureaucrats with varying abilities will be replaced under the challenger administration and the continuing incumbent administration. Note that we assume no entrenchment, and there will be no type $a_{2}^{\text {entr }}$.

The decisions of the challenger and the incumbent will differ only with respect to the bureaucrats that are loyal to the incumbent. Bureaucrats that are loyal to the challenger will be replaced at the same rate under a continuing incumbent administration and a challenger administration. Under the challenger, there will be the following distribution of bureaucrats that are loyal to the incumbent:

$$
\begin{gathered}
\gamma_{0}\left(a_{3} ; \text { incumbent }\right)=1 \\
\gamma_{0}\left(a_{2} ; \text { incumbent }\right)=0 \\
\gamma_{0}\left(a_{1} ; \text { incumbent }\right)=0 \\
\text { Under the continuing } \\
\text { ureaucrats that are loya } \\
\gamma_{0}\left(a_{3} ; \text { incumbent }\right)=1 \\
\gamma_{0}\left(a_{2} ; \text { incumbent }\right)=1 \\
\gamma_{0}\left(a_{1} ; \text { incumbent }\right)=0
\end{gathered}
$$

Under the continuing incumbent, there will be the following distribution of bureaucrats that are loyal to the incumbent:

From this we can see that:
$P\left(\right.$ Replaced $\mid a_{3}$, Challenger admin. $)-P\left(\right.$ Replaced $\mid a_{3}$, Incumbent admin. $)=0-$ $0=0$

While
$P\left(\right.$ Replaced $\mid a_{1}$ or $a_{2}$, Challenger admin. $)=1>P\left(\right.$ Replaced $\mid a_{1}$ or $a_{2}$, Incumbent admin. $)$
Example 2: The second example is more straightforward and driven by how we interpret an ideology transition. Political turnover that is accompanied by ideology transition leads to a challenger who faces a much larger number of bureaucrats that are loyal to the incumbent. In the model, the excess replacement rate that occurs when a challenger takes office is higher when the number of bureaucrats that are loyal to the incumbent is higher. Since the additional bureaucrats that are replaced are the mid-ability non-loyalists. If the number of non-loyalists across all ability-levels is larger, there will be higher number of mid-ability non-loyalist to replace. Hence, the prediction that political turnover accompanied with political transition result in a higher replacement rate of bureaucrats.

[^0]:    This table shows additional descriptive statistics for school-level characteristics in municipalities that did not have political party turnover and municipalities that did have political party turnover in close elections, $\mid$ IncumbVoteMargin|<.09, in Columns 1-2. Column 3 tests for a discontinuity in baseline characteristics at the IncumbVoteMargin=0 threshold: This column reports the p-value corresponding to the coefficient on $\mathbb{1}\{$ IncumbVoteMargin $<0\}$ in our main specification, Equation 1, with the corresponding variable at baseline used as the dependent variable. The remaining set of characteristics are shown in Table 1.

[^1]:    This table reports the coefficient on political party turnover estimating Equation 1. Outcome variables: New Municipal Personnel by contract type ( as $\%$ of total personnel in that contract type) is the ratio between the number of new labor contracts (of a given type) that had been added 12 months after the election divided by the total number of contracts (of a given type) in the month prior to the election; in Panel B, Municipal Personnel Who have Left by contract type ( as \% of total personnel in that contract type) is analogous and uses number of terminated contracts.

[^2]:    This table reports the coefficient on political party turnover from regressing each of the outcome variables (survey responses) on the running variable of the RDD (IncumbVoteMargin), political party
